[1] INTRODUCTION

OVERVIEW

Altair Panopticon™ Real Time supports the following data connectors:

- ❑ **General Connectivity:** MS Excel, Text, XML, JSON, Restful Web services, JDBC Databases
- ❑ **Big Data:** Cassandra, Elasticsearch 6.x, Elasticsearch 7.x, KsqlDB, Livy Spark, MongoDB, Splunk
- ❑ **Event Processing:** Kx kdb+Tick, OneMarketData OneTick CEP, Tibco Streambase, Tibco LiveView, Panopticon Streams
- ❑ **Messaging Streaming:** Apache/Confluent Kafka, JMS (e.g., ActiveMQ), Solace, RabbitMQ, WebSocket, JMX, Google Cloud Pub/Sub, MQTT
- ❑ **Tick Data:** OneMarketData OneTick, OneTick Cloud, Kx kdb+, InfluxDB
- ❑ Custom code data connections, transforms, and ML model scoring: Python, R, and REST service calls

In addition, Panopticon Real Time includes a Panopticon bundle file of example workbooks (**Examples.exz**). To use the example workbooks, the [bundle file must be imported](#) into the server after the server installation.

NOTE

- Beginning with version 17.1, MS Access, Valo, Apache Qpid, Valo Streaming, Ultra Messaging Streams, and OData connectors are deprecated.
- Beginning with version 16.2, DataDirect based connectors, along with Vertica, are deprecated. The Database connector or JDBC Database connector should be used.
- Existing workbooks will continue to operate, but connectivity will need to be migrated for subsequent releases.

SYSTEM REQUIREMENTS

Panopticon Real Time is supported on these operating systems:

- ❑ Linux which includes the following distributions and versions:
 - RHEL/CentOS 7 or higher
 - Debian 8 or higher
 - Ubuntu 14 or higher
 - Fedora 21 or higher
- ❑ Windows 10 (64-bit) – For Development Environments Only
- ❑ Windows Server 2012 (64-bit)

- ❑ Windows Server 2016 (64-bit)

Panopticon Real Time also requires:

- ❑ Oracle Java SE 8, Oracle Java SE 11, Open JDK 8, and Open JDK 11 are supported after installing the dependency files that are distributed with Panopticon Real Time.

NOTE	<ul style="list-style-type: none"> • Unzip the contents of the dependency package file provided by Panopticon into the <code>TOMCAT_HOME/lib</code> folder to be able to run Altair Panopticon software on JRE 11 and Open JDK 11. • Please refer to Java documentation about setting up the <code>JAVA_HOME</code> environment variable in your system.
-------------	--

- ❑ Apache Tomcat 9.0.x

NOTE	<p>When running on Windows instead of Linux, it is recommended to use the zip distribution of Apache Tomcat for Windows rather than the Windows Service Installer. This is because the zip distribution will let you run Apache Tomcat without any dependency on the Windows service manager, and management of the Apache Tomcat server will conform more with how it is done on Linux.</p>
-------------	--

NOTE	<p>Starting with Tomcat 9, Debian Linux implements a security policy which puts a harder default restriction on which folders a Tomcat 9 web application can write to.</p> <p>The change is described in full detail here: https://salsa.debian.org/java-team/tomcat9/-/commit/3ca5cbdc2f970470341926354f210dff032fc5f3</p> <p>Quoting from the release notes:</p> <ul style="list-style-type: none"> • Tomcat is sandboxed by <code>systemd</code> and only has write access to the following directories: <table border="1" data-bbox="454 1333 1295 1554"> <thead> <tr> <th>Directory</th> <th>Actual Directory</th> </tr> </thead> <tbody> <tr> <td><code>/var/lib/tomcat9/conf/Catalina</code></td> <td><code>/etc/tomcat9/Catalina</code></td> </tr> <tr> <td><code>/var/lib/tomcat9/logs</code></td> <td><code>/var/log/tomcat9</code></td> </tr> <tr> <td><code>/var/lib/tomcat9/webapps</code></td> <td></td> </tr> <tr> <td><code>/var/lib/tomcat9/work</code></td> <td><code>/var/cache/tomcat9</code></td> </tr> </tbody> </table> <ul style="list-style-type: none"> • If write access to other directories is required, override the service settings. This is done by creating an <code>override.conf</code> file in <code>/etc/systemd/system/tomcat9.service.d/</code> containing: <pre>[Service] ReadWritePaths=/path/to/the/directory/</pre> <p>Ensure to restart the service afterward with:</p> <ul style="list-style-type: none"> o <code>systemctl daemon-reload</code> 	Directory	Actual Directory	<code>/var/lib/tomcat9/conf/Catalina</code>	<code>/etc/tomcat9/Catalina</code>	<code>/var/lib/tomcat9/logs</code>	<code>/var/log/tomcat9</code>	<code>/var/lib/tomcat9/webapps</code>		<code>/var/lib/tomcat9/work</code>	<code>/var/cache/tomcat9</code>
Directory	Actual Directory										
<code>/var/lib/tomcat9/conf/Catalina</code>	<code>/etc/tomcat9/Catalina</code>										
<code>/var/lib/tomcat9/logs</code>	<code>/var/log/tomcat9</code>										
<code>/var/lib/tomcat9/webapps</code>											
<code>/var/lib/tomcat9/work</code>	<code>/var/cache/tomcat9</code>										

```
○ systemctl restart tomcat9
```

Panopticon Real Time is supported for deployment on the following cloud providers:

- Amazon Web Services (AWS)
- Microsoft Azure
- Google Cloud Platform
- Oracle Cloud

Containerized deployment with Docker Linux containers is also supported.

Supported browsers include the latest version of:

- Google Chrome
- Safari

NOTE

- Panopticon Real Time requires administrative privileges during installation. Administrative privileges are not required after installation is complete.
- Panopticon Real Time does not support Tomcat 7.x, Tomcat 8.0.x, or Tomcat 8.5.x.

System Hardware Requirements

Development / Test

- 1 x Dual Core CPU (Hyper Threaded to 4 Cores/Threads)
- 8GB RAM
- 4GB Disk (Available)
- In Memory Caching limited to available Server RAM

Small Scale Deployment

- 1 x Quad Core CPU Or Equivalent (Hyper Threaded to 8 Cores/Threads)
- 16GB RAM
- 4GB Disk (Available)
- In Memory Caching limited to available Server RAM

Medium Scale Deployment

- 4 x Quad Core CPU Or Equivalent (Hyper Threaded to 32 Cores/Threads)
- 32GB RAM
- 4GB Disk (Available)
- In Memory Caching limited to available Server RAM

Large Scale Deployment

- 8 x Quad Core CPU Or Equivalent (Hyper Threaded to 64 Cores/Threads)
- 64GB RAM
- 4GB Disk (Available)
- In Memory Caching limited to available Server RAM

Server Platforms

Panopticon Real Time consist of multiple components such as the following:

Components	Description
Panopticon Real Time	Formerly named Panopticon Visualization Server, responsible for managing all the published workbooks and all the resources that go with them. It is also responsible for authorization, data connections, transformations, scheduled tasks, report generation, alerting, etc.
Panopticon Streams	Processing of data streams for real-time visualization in dashboards.
Web Client	The web client is a graphical interface for administration of the server and for creation and design of dashboard applications.

See [Installation](#) for more information.

ENVIRONMENT PROMOTION OPTIONS

You may need to set up multiple environments for Altair Panopticon. For example, you may wish to set up your system to support one of the following migration paths:

- Staging → Production
- Development → User Acceptance Testing → Production

The primary complication when promoting workbooks between environments is access to data repositories, since you may wish to use separate data repositories for each environment. If you require different data repositories in each environment, use JNDI or global parameters. These abstract the location of the data repository from the workbook.

INSTALLATION

This document provides instructions on how to install Panopticon Real Time on [Linux](#) or [Windows](#).

NOTE

If you need to upgrade your previously installed Panopticon Real Time, proceed to the [Upgrade](#) section.

Setting Up Panopticon Real Time on Linux

Follow the steps and guidelines below to install Panopticon Real Time on Linux.

Steps:

1. Extract the contents of `AltairPanopticonVisualizationServerWAR_<version number>.zip` file to a new location.

This zip file will contain the following folder and files:

- pci-java folder
- tomcat-users_example.xml
- start_Python_connectivity.sh
- start_Python_connectivity.bat
- pyro.py
- panopticon.xml
- panopticon.war
- PanopticonJNDIRealm.jar
- [OpenJDK11Dependencies_README.txt](#)
- [OpenJDK11Dependencies.zip](#)
- [Examples.exz](#)
- CustomMessageParserExample.zip
- Elastic_5X_Dependencies.zip
- Elastic_6X_Dependencies.zip
- Elastic_7X_Dependencies.zip
- Panopticon Web Authoring Quick Start Guide
- Panopticon Web Authoring Guide
- Panopticon Real Time Installation and Reference Guide
- User_License.rtf

NOTE

To support Python Transform, the following files are included in the installation zip file:

- start_Python_connectivity.sh
- start_Python_connectivity.bat
- pyro.py

Refer to [Python Integration](#) for more information.

2. Create the AppData folder (i.e., /usr/share/vizserverdata) and ensure that the user account Local Service running Tomcat has read/write and execute permissions to this folder.
3. In the Tomcat config folder (/tomcat_home/conf/Catalina/localhost) create the panopticon.xml file with the following information:

```
<?xml version="1.0" encoding="UTF-8"?>
<Context path="/panopticon">
    <Environment name="PanopticonAppData" override="false"
type="java.lang.String" value="/usr/share/vizserverdata" />
</Context>
```

NOTE

- Instead of setting the path of the environment variable `PanopticonAppData` on the `panopticon.xml` file, you can do so on the System Environment Variables. For example:

Variable	New Value
<code>PanopticonAppData</code>	<code>/usr/share/panopticondata</code>

- If the directory path is set in both an environment variable and in the `panopticon.xml` file, the value set in the XML file will take precedence.
- Starting with 21.2, the `DatawatchVDDAppData` is replaced with `PanopticonAppData` as the specifier for the Panopticon application data directory. You can still use `DatawatchVDDAppData` as a fallback, but going forward, `PanopticonAppData` should be used.

4. Copy the `panopticon.war` file into the Tomcat webapps folder (`/tomcat_home/webapps`).
5. For a basic installation using the Tomcat inbuilt XML file user directory, copy the provided `tomcat-users_example.xml` and overwrite the existing `tomcat-users.xml` file which is available in the Tomcat config folder (`/tomcat_home/conf`).

The provided `tomcat-users_example.xml` contains the following roles and users:

```
<role rolename="user"/>
<role rolename="designer"/>
<role rolename="admin"/>
<user username="viewer" password="viewer" roles="user" />
<user username="designer" password="designer" roles="user,designer" />
<user username="admin" password="admin" roles="user,admin"/>
<user username="su" password="su" roles="user,designer,admin"/>
```

NOTE

In Panopticon 2020.0 and onwards, the `Administrators.txt` and `AdministratorGroup.txt` files are no longer used to authorize administrator users. The function provided by these files has been replaced by a set of properties in [Panopticon.properties](#):

```
access.default.roles=VIEWER
access.administrator.groups=admin
access.designer.groups=designer
access.viewer.groups=
```

The `access.default.roles` property defines the default roles assigned to any user accessing the server, defaulting to `VIEWER`. The administration (`access.administrator.groups` property) and content creation (`access.designer.groups` property) on the server are mapped by default to groups named "admin" and "designer".

For more complex authentication and user directory options, see section [\[3\]](#)

[Authentication.](#)

- IMPORTANT**
- Before proceeding to step 7, ensure the Tomcat temp folder (e.g., `/tomcat_home/temp`) is available.
 - You can opt to choose a different temp folder with the `CATALINA_TMPDIR` environment variable. For example:

Variable	Value
<code>CATALINA_TMPDIR</code>	<code>/tomcat_home/dev/temp</code>

6. Start Tomcat to deploy the `panopticon.war` file.

The server initializes the `AppData` directory with an empty content repository and empty subdirectories for other types of data. The [Panopticon.properties](#) file is created with the default server properties.

7. Specify the license type that will be used. Use any of the following license types:
 - Volume License file (**PanopticonLicense.xml**) that must be copied to the designated `AppData` folder.
 - Altair Units license. Refer to [Using Altair Units License in Altair's License Server](#) for more information.
 - Managed Altair Units license. Refer to [Using Managed Altair Units License Via Altair One](#) for more information.
8. Increase the Java heap size of Tomcat.
9. You can also opt to install Java data connector's dependencies.
10. You should now be able to log on to Panopticon Real Time using the following:

```
[Host Name]:[Port]/[Name of your application]
```

For example:

```
http://localhost:8080/panopticon
```

The more advanced configuration options are also discussed in this document.

Setting Up Panopticon Real Time on Windows

Follow the steps and guidelines below to install Panopticon Real Time on Windows.

Steps:

1. Extract the contents of `AltairPanopticonVisualizationServerWAR_<version number>.zip` file to a new location.

This zip file will contain the following folder and files:

- `pcli-java` folder
- `tomcat-users_example.xml`
- `start_Python_connectivity.sh`

- start_Python_connectivity.bat
- pyro.py
- panopticon.xml
- panopticon.war
- PanopticonJNDIRealm.jar
- [OpenJDK11Dependencies_README.txt](#)
- [OpenJDK11Dependencies.zip](#)
- [Examples.exz](#)
- CustomMessageParserExample.zip
- Elastic_5X_Dependencies.zip
- Elastic_6X_Dependencies.zip
- Elastic_7X_Dependencies.zip
- Panopticon Web Authoring Quick Start Guide
- Panopticon Web Authoring Guide
- Panopticon Real Time Installation and Reference Guide
- User_License.rtf

NOTE

To support Python Transform, the following files are included in the installation zip file:

- start_Python_connectivity.sh
- start_Python_connectivity.bat
- pyro.py

Refer to [Python Integration](#) for more information.

2. Create the AppData folder (i.e., **vizserverdata**) and ensure that the user account Local Service running Tomcat has read/write and execute permissions to this folder.

Example: c:\vizserverdata

3. Copy the extracted panopticon.xml file into the Tomcat config folder (\Apache Software Foundation\Tomcat 9.0\conf\Catalina\localhost). This file contains the following information:

```
<?xml version="1.0" encoding="UTF-8"?>
<Context>
    <Environment name="PanopticonAppData" override="false"
type="java.lang.String" value="c:\vizserverdata" />
</Context>
```

NOTE

Instead of setting the path of the environment variable `PanopticonAppData` on the `panopticon.xml` file, you can do so on the System Environment Variables. For example:

Variable	New Value
<code>PanopticonAppData</code>	<code>c:\panopticondata</code>

If the directory path is set in both an environment variable and in the `panopticon.xml` file, the value set in the XML file will take precedence.

Starting with 21.2, the `DatawatchVDDAppData` is replaced with `PanopticonAppData` as the specifier for the Panopticon application data directory. You can still use `DatawatchVDDAppData` as a fallback, but going forward, `PanopticonAppData` should be used.

4. Copy the `panopticon.war` file into the Tomcat webapps folder (`\Apache Software Foundation\Tomcat 9.0\webapps`).
5. For a basic install using the Tomcat inbuilt XML file user directory, copy the provided `tomcat-users_example.xml` and overwrite the existing `tomcat-users.xml` file which is available in the Tomcat config folder (`\Apache Software Foundation\Tomcat 9.0\conf`).

The provided `tomcat-users_example.xml` contains the following roles and users:

```
<role rolename="user"/>
<role rolename="designer"/>
<role rolename="admin"/>
<user username="viewer" password="viewer" roles="user" />
<user username="designer" password="designer" roles="user,designer" />
<user username="admin" password="admin" roles="user,admin"/>
<user username="su" password="su" roles="user,designer,admin"/>
```

NOTE

In Panopticon 2020.0 and onwards, the `Administrators.txt` and `AdministratorGroup.txt` files are no longer used to authorize administrator users. The function provided by these files has been replaced by a set of properties in [Panopticon.properties](#):

```
access.administrator.groups=admin
access.default.roles=VIEWER
access.designer.groups=designer
access.viewer.groups=user
```

The `access.default.roles` property defines the default roles assigned to any user accessing the server, defaulting to `VIEWER`. The administration (`access.administrator.groups` property) and content creation (`access.designer.groups` property) on the server are mapped by default to groups named "admin" and "designer".

For more complex authentication and user directory options, see section [\[3\] Authentication](#).

- You can also opt to install [Java data connector's dependencies](#), and [JDBC driver JAR](#) files as required.

IMPORTANT

- Before proceeding to step 8, ensure the Tomcat temp folder (e.g., (\Apache Software Foundation\Tomcat 9.0\temp) is available.
- You can opt to choose a different temp folder with the CATALINA_TMPDIR environment variable. For example:

Variable	Value
CATALINA_TMPDIR	C:\tomcat\dev\temp

- Start Tomcat to deploy the .war file.

The panopticon folder is extracted in the Tomcat webapps folder:

The server initializes the AppData directory with an empty content repository and empty subdirectories for other types of data. The [Panopticon.properties](#) file is created with the default server properties.

- Specify the license type that will be used. Use any of the following license types:
 - Volume License file (**PanopticonLicense.xml**) that must be copied to the designated AppData folder.
 - Altair Units license. Refer to [Using Altair Units License in Altair's License Server](#) for more information.
 - Managed Altair Units license. Refer to [Using Managed Altair Units License Via Altair One](#) for more information.
- Increase the [Java heap size of Tomcat](#).
- You should now be able to log on to Panopticon Real Time using the following:

[Host Name]:[Port]/[Name of your application]

For example:

<http://localhost:8080/panopticon>

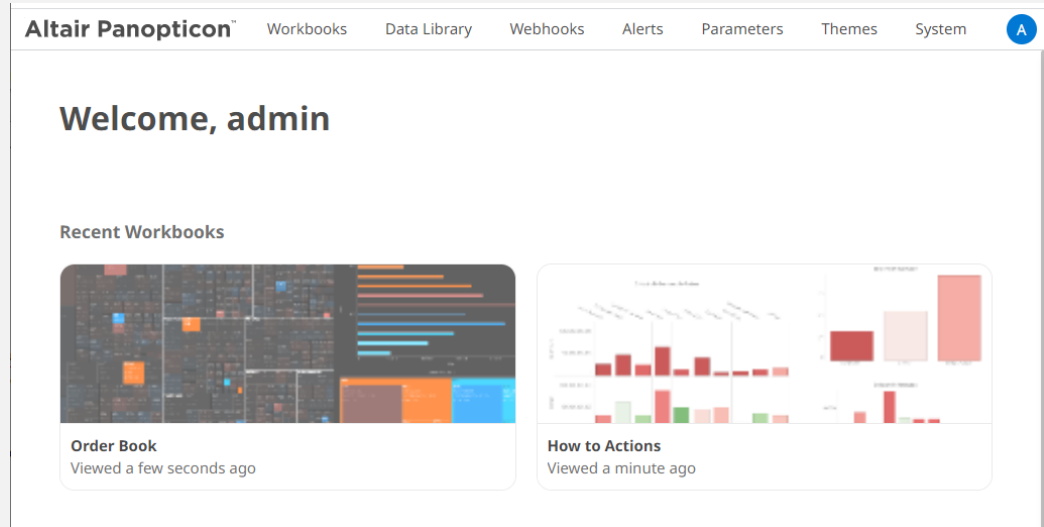

The more advanced configuration options are also discussed in this document.

NOTE

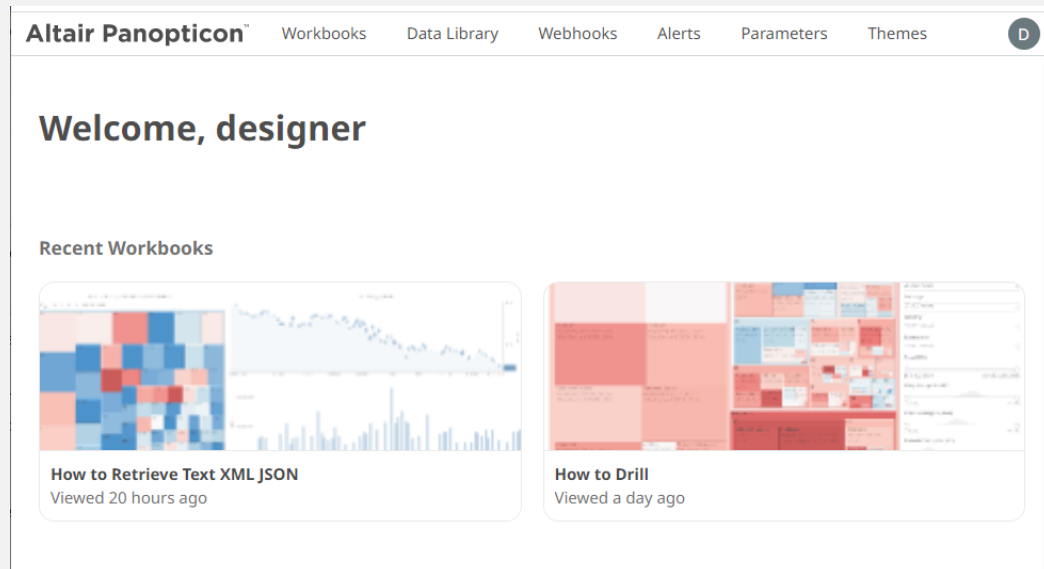

Panopticon Real Time supports different user roles. To have full access to all the services, the user is required to have ADMINISTRATOR and DESIGNER roles.

For example, logging on using the ADMINISTRATOR role added in step 6 (i.e., admin/admin), [will display](#):

All of the available user specific folders in the [authentication](#) method used are displayed.

However, logging on with a DESIGNER role (i.e., designer/designer) will only display:

The allowed features available for the DESIGNER role is extensively discussed in the [Web Authoring Guide](#).

Open JDK 11+ Dependencies

The `AltairPanopticonVisualizationServerWAR_<version number>.zip` file includes `OpenJDK11Dependencies.zip` which contains necessary dependencies for running Altair Panopticon software on Open JDK 11 and up.

The overview, installation, and list of the contents of `OpenJDK11Dependencies.zip` are provided and discussed in the `OpenJDK11Dependencies_README.txt` file.

Background

In Java 9, a number of Java EE modules were marked for deprecation, and subsequently removed completely from Java 11.

With missing Java EE dependencies, the typical exceptions would include `NoClassDefFoundError` exceptions being thrown for `javax/xml/bind` classes.

```
Exception in thread "main" java.lang.NoClassDefFoundError:
javax/xml/bind/JAXBException
    at monitor.Main.main(Main.java:27)
Caused by: java.lang.ClassNotFoundException: javax.xml.bind.JAXBException
    at
    java.base/jdk.internal.loader.BuiltinClassLoader.loadClass(BuiltinClassLoader.java:582
)
    at
    java.base/jdk.internal.loader.ClassLoaders$AppClassLoader.loadClass(ClassLoaders.java:
185)
    at java.base/java.lang.ClassLoader.loadClass(ClassLoader.java:496)
    ... 1 more
```

In order to support deployment on either Java 1.8 or Open JDK 11+, we have packaged the necessary Java EE dependencies separately for simple installation in Tomcat.

Installation

Do the following to make the dependencies available to the JVM and the Altair Panopticon server:

1. Stop Tomcat.
2. Unzip the contents of `OpenJDK11Dependencies.zip` into the `TOMCAT_HOME/lib` folder.
3. Start Tomcat.

Zip File Content

- ❑ Jakarta XML Binding API (`jakarta.xml.bind-api`), version 2.3.2
 - `jakarta.xml.bind-api-2.3.2.jar`
 - `jakarta.activation-api-1.2.1.jar`
- ❑ JAXB Runtime (`jaxb-runtime`), version 2.3.2
 - `jakarta.xml.bind-api-2.3.2.jar`
 - `txw2-2.3.2.jar`
 - `istack-commons-runtime-3.0.8.jar`
 - `jakarta.activation-api-1.2.1.jar`

The Welcome Page

The *Welcome* page is the first screen that displays when you log on to Panopticon Real Time. This page can also be accessed by clicking the **Altair Panopticon** logo on the header.

The screenshot shows the 'Welcome, admin' page. At the top is a navigation bar with the 'Altair Panopticon' logo and links for 'Workbooks', 'Data Library', 'Webhooks', 'Alerts', 'Parameters', 'Themes', and 'System'. A user profile icon with the letter 'A' is in the top right. The main content area features a 'Welcome, admin' heading, a 'Recent Workbooks' section with two thumbnails ('Order Book' and 'How to Actions'), and a 'Getting Started' section with three cards: 'Explore', 'Quick Start', and 'Documentation'. Each card includes an icon, a title, a brief description, and a button to interact with the content.

From this page you can:

- Open recently viewed workbooks (if available)
- [Explore workbooks available in your organization](#)
- [Open the Analyst User Guide](#)
- [View online documentation and help](#)

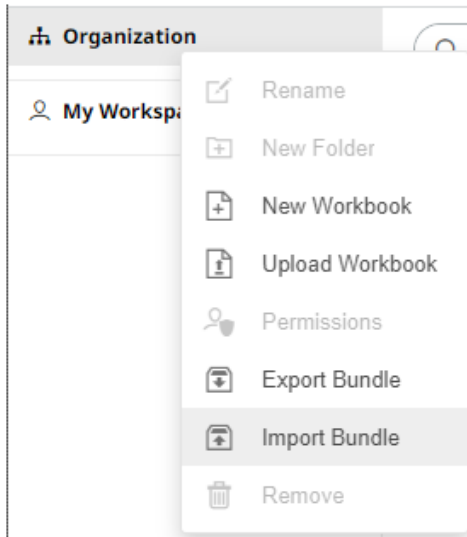

Importing the Bundle of Example Workbooks

The `AltairPanopticonVisualizationServerWAR_<version number>.zip` file includes the bundle file of the example workbooks and their associated data files (`Examples.exz`).

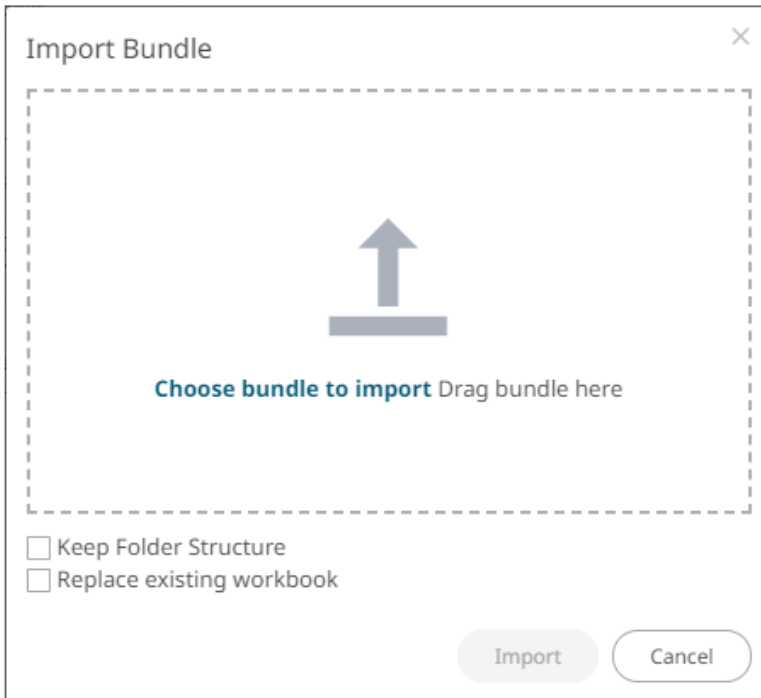

Follow the instructions below to import this bundle to Panopticon Real Time.

Steps:

1. On the *Workbooks and Folders Summary* page, right-click on a folder and select **Import Bundle** on the context menu.

The *Import Bundle* dialog displays.

2. To import the bundle, you can either:

- drag it from your desktop and drop on the dialog, or
- click **Choose Bundle to Import** and select one on the *Open* dialog that displays.

The name of the selected bundle is displayed on the dialog box.

3. Check the **Keep Folder Structure** box.

This means the exported folder structure is maintained when uploading the bundle. If the folders do not exist on the server, they will be created.

4. To replace an existing workbook, check the **Replace existing workbook** box.

5. Click .

The example workbooks that you can view and explore are imported.

CONFIGURATION OF THE CLIENT PROPERTIES

Starting with version 2020.1, Panopticon Real Time generates JSON configuration files in the `JavaScriptConfiguration` directory of the `AppData` folder (i.e., `c:\vizserverdata`).

This PC > Windows (C:) > vizserverdata > JavaScriptConfiguration				
<input type="checkbox"/>	Name	Date modified	Type	Size
	admin.json	10/11/2020 8:48 PM		1 KB
	workbook.json	10/11/2020 8:48 PM		1 KB

NOTE

In the JSON files, a dot in the name (e.g., name1.name2) is used to denote a nested object structure:

```
{
  "name1": {
    "name2": ...
  }
}
```

The default content of the `admin.json` file has the following objects/names:

```
{
  "baseUrl" : ".",
  "hideAuthenticationButton" : false,
}
```

In the `admin.json` file, you can control the configuration of the following objects/names:

Object/Name	<code>automaticReconnectOnServerDisconnect</code>
Description	If set to true , the real time connection (WebSocket or long polling) to the Panopticon server will be automatically reconnected if it is disconnected.
Default Value	false
Required	No
Object/Name	<code>baseUrl</code>
Description	Location of Panopticon Real Time.
Default Value	."
Required	Yes
Object/Name	<code>dataLoading.transport</code>
Description	Controls which transport should be used when viewing log from the server. Valid values are " websocket " and " long-polling ". If configured to " websocket ", but the WebSocket connection fails, then the web client will automatically fall back to " long-polling ".
Default Value	"websocket"
Required	No
Object/Name	<code>hideAuthenticationButton</code>
Description	Boolean. Hides the login and logout buttons.
Default Value	false
Required	No
Object/Name	<code>localization.defaultLocale</code>

Description	Locale used if the browser locale is not supported, or if the <code>useBrowserLocale</code> is set to false .
Default Value	"en-US"
Required	No
Object/Name	<code>localization.fallbackLocale</code>
Description	Locale used if a resource string is missing from the locale in use. Should be specified if <code>localization.defaultLocale</code> is specified.
Default Value	value of <code>localization.defaultLocale</code>
Required	No
Object/Name	<code>localization.useBrowserLocale</code>
Description	Boolean. If set to true , the browser <code>navigator.language</code> , <code>navigator.userLanguage</code> on IE11, controls the localization of the UI. Not all languages are supported.
Default Value	true
Required	No
Object/Name	<code>localizationOverride</code>
Description	Nested object with resource strings per language. Used to customize resource strings.
Default Value	
Required	No
Object/Name	<code>logLevel</code>
Description	Controls which types of logs Panopticon will write to the browser dev console. Valid values are: "trace" , "debug" , "info" , "warn" , "error" and "silent" .
Default Value	"info"
Required	No
Object/Name	<code>workbookUrl</code>
Description	Location of the workbook application. NOTE: The <code>workbookUrl</code> property should reflect the actual location of the workbook application, but it doesn't rename or change the location of said application.
Default Value	"workbook"
Required	Yes

The default content of the `workbook.json` file has the following objects/names:

```
{
  "baseUrl" : "..",
  "forceClientSelectionHandling" : true,
  "startUrl" : "../",
  "subscriptionCompression" : true,
  "dataLoading" : {
    "transport" : "websocket"
  },
  "webGleEnabled" : true,
  "pdfMultiplePagesEnabled" : true
}
```

In the `workbook.json` file, you can control the configuration of the following objects/names:

Object/Name	<code>baseUrl</code>
Description	Location of Panopticon Real Time.
Default Value	<code>".."</code>
Required	Yes
Object/Name	<code>localization.useBrowserLocale</code>
Description	Boolean. If set to true , the browser <code>navigator.language</code> , <code>navigator.userLanguage</code> on IE11, controls the localization of the UI. Not all languages are supported.
Default Value	true
Required	No
Object/Name	<code>localization.defaultLocale</code>
Description	Locale used if the browser locale is not supported, or if <code>useBrowserLocale</code> is set to false .
Default Value	"en-US"
Required	No
Object/Name	<code>localization.fallbackLocale</code>
Description	Locale used if a resource string is missing from the locale in use. Should be specified if <code>localization.defaultLocale</code> is specified.
Default Value	value of <code>localization.defaultLocale</code>
Required	No
Object/Name	<code>localizationOverride</code>
Description	Nested object with resource strings per language. Used to customize resource strings.
Default Value	
Required	No
Object/Name	<code>logLevel</code>

Description	Controls which types of logs Panopticon will write to the browser dev console. Valid values are: "trace" , "debug" , "info" , "warn" , "error" and "silent" .
Default Value	"info"
Required	No
Object/Name	<code>disableExternalHelpText</code>
Description	Disables the browser dev console splash screen.
Default Value	false
Required	No
Object/Name	<code>theme</code>
Description	Name of the default theme for all workbooks. Per default, the first theme available is picked as the default theme.
Default Value	
Required	No
Object/Name	<code>allowOrigin</code>
Description	A comma separated list of allow origins, used by the Panopticon POST message API.
Default Value	
Required	No
Object/Name	<code>automaticReconnectOnServerDisconnect</code>
Description	If set to true , the real time connection (WebSocket or long polling) to the Panopticon server will be automatically reconnected if it is disconnected.
Default Value	false
Required	No
Object/Name	<code>alwaysHideNonInteractiveParametersInDialog</code>
Description	Hides parameters that are not interactive when displaying the interactive parameter dialog.
Default Value	false
Required	No
Object/Name	<code>enableDevicePixelRatioCanvasScaling</code>
Description	Enable or disable handling of device pixel ratio for 2D visualizations.
Default Value	true
Required	No
Object/Name	<code>staleStateTimeout</code>
Description	Time (in milliseconds) that controls how fast the "stale data" overlay should be rendered on top of visualizations. Only applies to those interactions that doesn't show "data loading" animation. A value equal to or less than zero will disable the stale data overlay.
Default Value	150

Required	No
Object/Name	<code>preloadDetailsPopup</code>
Description	Data to be shown in the <i>Details</i> pop-up is preloaded as part of the visualization data request. If set to false , then the details data will be loaded on demand.
Default Value	true
Required	No
Object/Name	<code>forceClientSelectionHandling</code>
Description	If set to true , then selection handling in the visualizations will be performed by the client. If set to false , then the server will calculate the selection.
Default Value	false
Required	No
Object/Name	<code>subscriptionCompression</code>
Description	Controls if data query strings longer than 2048 chars should be compressed by the web client before sending them to the server.
Default Value	false
Required	No
Object/Name	<code>pdfMultiplePagesEnabled</code>
Description	Controls the visibility of the "Create multiple pages..." checkbox in the ad hoc PDF report dialog.
Default Value	true
Required	No
Object/Name	<code>startUrl</code>
Description	URL used by the Back button, and by the dialog for unexpected errors. If this property is removed and <code>useBrowserHistoryToNavigateBack</code> is false , then the Back button will not be displayed.
Default Value	
Required	No
Object/Name	<code>useBrowserHistoryToNavigateBack</code>
Description	If set to true , then the Back button will be visible and the button will execute <code>window.history.back()</code> when pressed. This setting takes precedence over having a configured <code>startUrl</code> .
Default Value	true
Required	No
Object/Name	<code>hideThemeSelection</code>
Description	Controls the visibility of the theme drop down.
Default Value	false
Required	No

Object/Name	<code>dataLoading.transport</code>
Description	Controls the which transport should be used when loading data from the server and receiving notifications. Valid values are " websocket " and " long-polling ". If configured to " websocket ", but the WebSocket connection fails, then the web client will automatically fall back on " long-polling ".
Default Value	"websocket"
Required	No
Object/Name	<code>dataLoading.connectTimeout</code>
Description	Controls the timeout used, in milliseconds, when opening the data loading connection to the server.
Default Value	10000
Required	No
Object/Name	<code>preventVisualizationMouseWheelDefaultEvents</code>
Description	Prevents the browser default action when using the mouse wheel over a visualization. Useful in an embed scenario if the hosting web page is scrolled when the user tries to zoom in a visualization using the mouse wheel.
Default Value	false
Required	No
Object/Name	<code>webGleEnabled</code>
Description	Enables the use of WebGL in visualizations that supports it.
Default Value	true
Required	No
Object/Name	<code>maxClipboardLength</code>
Description	Maximum length of text that will be attempted to be put into the system clipboard (copy). If too much text is attempted, then the browser might become unresponsive.
Default Value	500000
Required	No
Object/Name	<code>selectionInDetailsPopup</code>
Description	Enables/disables selection data in the visualization details popup. Primary use case for this setting is to disable it on a server level.
Default Value	true
Required	No
Object/Name	<code>showAlertsButton</code>
Description	Controls the visibility of the Alerts workbook button.
Default Value	true
Required	No
Object/Name	<code>showBookmarksButton</code>

Description	Controls the visibility of the Bookmarks workbook button.
Default Value	true
Required	No
Object/Name	<code>showCopyDashboardImageButton</code>
Description	Controls the visibility of the Copy Image workbook button.
Default Value	true
Required	No
Object/Name	<code>showPdfExportButton</code>
Description	Controls the visibility of the Create PDF Report workbook button.
Default Value	true
Required	No
Object/Name	<code>showRefreshDataButton</code>
Description	Controls the visibility of the Refresh workbook button.
Default Value	true
Required	No
Object/Name	<code>showPauseRealtimeButton</code>
Description	Controls the visibility of the Pause Real-Time workbook button.
Default Value	true
Required	No
Object/Name	<code>pluginDenyList</code>
Description	Array of plugin IDs, used to block the specified dashboard parts and visualizations.
Default Value	empty array
Required	No
Object/Name	<code>pluginAllowList</code>
Description	Array of plugin IDs, used to allow only the specified dashboard parts and visualizations. The default value, an empty array, allows all plugins.
Default Value	empty array
Required	No

NOTE

- With the new application configuration files, the `workbook/config.js` inside the extracted war file is no longer valid.
- If there are no config files available on the server, default ones will be created and saved. After that, you can alter them in any way you would like and keep the configuration even if the server is restarted.

LICENSING

Licensing within Panopticon Real Time supports the following license types:

- ❑ a volume-based XML file (named **PanopticonLicense.xml**) that is used to store all license information for a specific customer, must be copied to the designated AppData folder (i.e., **c:\vizserverdata**)

NOTE Starting with 21.2, the newly issued volume-based license file is named `PanopticonLicense.xml`. For customers with the `DatawatchLicense.xml` file, it can still be used but it is strongly recommended to rename it to `PanopticonLicense.xml`.

- ❑ [Altair Units license which is available in Altair's License server](#) you are connected to (local or over the network)
- ❑ [Managed Altair Units license via Altair One](#)

The license file type you will use is delivered separately from the installation packages.

NOTE In the Panopticon documentation, HyperWorks Units (HWU) and Hosted HyperWorks Units (HHWU) are now named Altair Units.

In the Panopticon product, these license types are still named HyperWorks Units and Hosted HyperWorks Units.

For more information on Altair Units, visit <https://www.altair.com/altair-units/>.

Using Altair Units License in Altair's License Server

If your license source is Altair's License server, it is required to configure the following properties in the [Panopticon.properties](#) file located in the AppData folder or `c:\vizserverdata`:

Property	Service authentication level
Attribute	<code>authentication.required</code>
Description	The property that will make the authentication required. It will force the user to login to use any of the services provided by the server. Must be set to true .
Default Value	true
Property	Licensing
Attribute	<code>license.hwu.uri</code>
Description	The path where the License Server is running e.g., 6200@191.255.255.0 where the syntax is <code>PORTNUMBER@HOST</code> . If multiple servers are specified, use the ';' semicolon separator sign for Windows and the ':' colon separator sign for Linux. NOTES:

	If value is not set in the <code>Panopticon.properties</code> , the environment variable ALTAIR_LICENSE_PATH serves as the backup path and will be used.
Example	For Windows: <code>license.hwu.uri=6200@192.168.5.51;6200@192.168.5.52</code> For Linux: <code>license.hwu.uri=6200@192.168.5.51:6200@192.168.5.52</code>
Default Value	
Property	Licensing
Attribute	<code>license.hwu.version</code>
Description	Value must match the license version found in the Altair Units license file.
Default Value	19.0
Property	Licensing
Attribute	<code>license.mode</code>
Description	The license mode. Possible values are FILE or HWU. Must be set to HWU .
Default Value	FILE

For example:

```
authentication.required=true
license.hwu.uri=6200@192.168.5.51;6200@192.168.5.52
license.hwu.version=19.0
license.mode=HWU
```

NOTE

- Panopticon Real Time supports different user roles which check out different numbers of Altair Units.

Role	Altair Units License Draw
Viewer	2
Designer	2 10 when designing a workbook
Administrator	2

- Alerts and scheduled tasks are leveled towards each other. Regardless of the number of alerts or scheduled tasks a user creates, only two Altair Units licenses will be checked out.
- These units are separate from the units that are checked out for a user of the server. For example, if a user is logged on to the server (two units) and starts an alert (two units), a total of four units are checked out. If the user then starts two more alerts and a scheduled task, the total number of checked out units will still be four. If the user logs out without shutting off any alerts, two units will remain checked out.
- Two products (e.g., Panopticon Real Time and Panopticon Streams) or

two instances of one product, must not be configured to use Altair unit licensing if they run on the same Tomcat.

Using Managed Altair Units License Via Altair One

Using the Altair Units licensing will support simplifying the license management by removing all manual aspects of emailing license files, extending evaluation periods, among others.

In addition, Altair Units licensing will help small to medium deployment customers who do not want to host on-premise license server.

Before using Altair Units, it is required to configure the following properties in the [Panopticon.properties](#) file located in the AppData folder or c:\vizserverdata:

Property	Licensing
Attribute	<code>license.hwu.hosted</code>
Description	Boolean stating if you wish to use Managed or Local Altair Units licensing. Set to true if you wish to use managed licensing.
Default Value	false
Property	Licensing
Attribute	<code>license.hwu.hosted.authorization.username</code>
Description	Username to the Altair One account.
Default Value	
Property	Licensing
Attribute	<code>license.hwu.hosted.authorization.password</code>
Description	Password to the Altair One account.
Default Value	
Property	Licensing
Attribute	<code>license.hwu.hosted.authorization.token</code>
Description	An authorization token generated through the Altair One admin portal. Used to authorize a machine to the managed Altair Units system.
Default Value	

NOTE

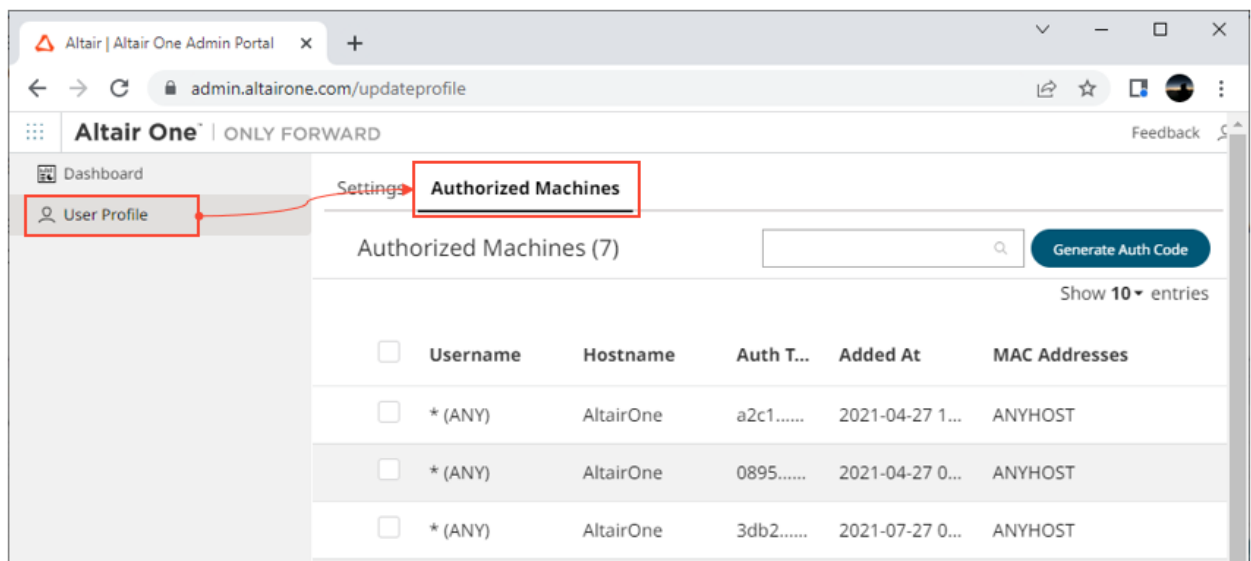

- To use the managed Altair Units licensing, set the following properties:
license.hwu.hosted=true
license.mode=HWU
authentication.required=true
license.hwu.version=20.0
- Add the Panopticon application to your Altair One account.

To authorize the machine against the managed Altair Units system, you have two options.

Option 1

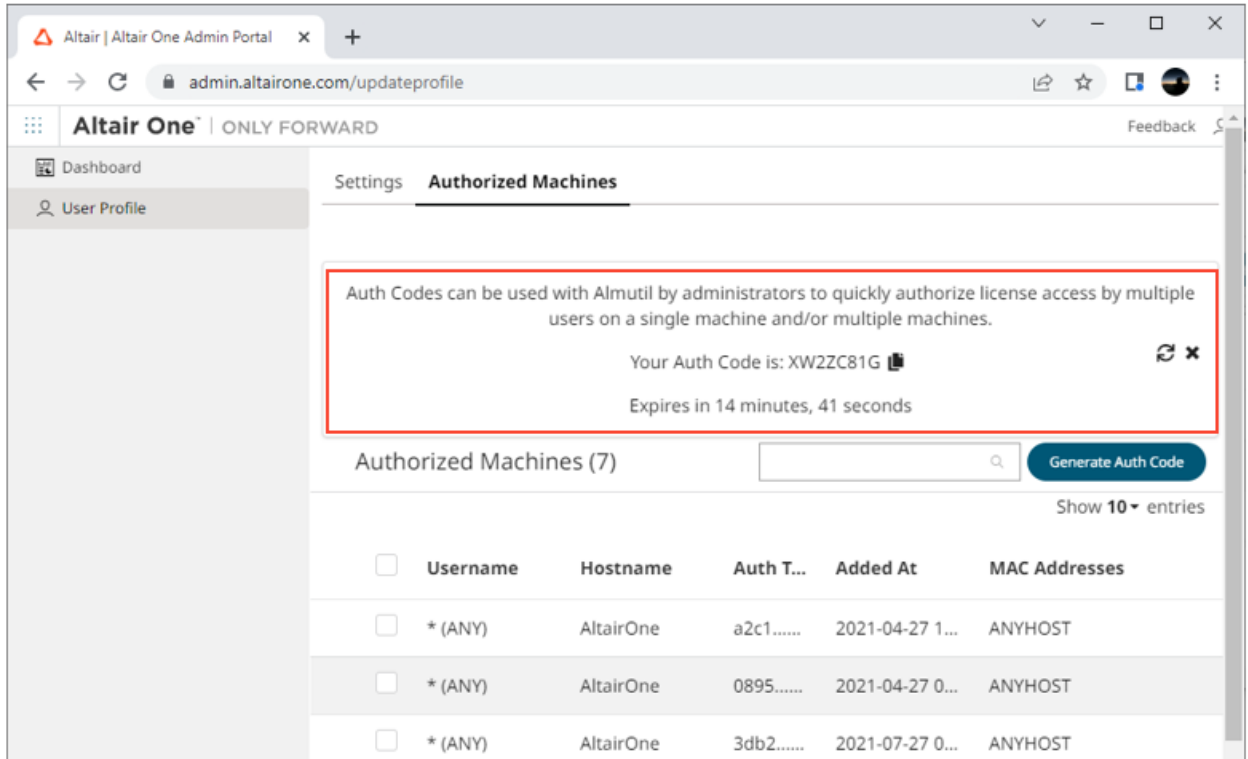

Use an authorization code generated through Altair One:

1. Log on to Altair One (<https://admin.altairone.com>) then navigate to **User Profile** and select **Authorized Machines**.

2. Click 

The page displays the auth code and a timer indicating the code's expiration.

Click **Copy to Clipboard**  to copy the generated auth code.

3. Paste the generated code into the `license.hwu.hosted.authorization.token` property in the `Panopticon.properties` file.
4. Start the server.

Option 2

Directly use your Altair One credentials in `Panopticon.properties`:

1. Enter your Altair One credentials into the `license.hwu.hosted.authorization.username` and `license.hwu.hosted.authorization.password` properties in the `Panopticon.properties` file.
2. Start the server.

NOTE

- If a token is entered, this will be tried first. If the token was invalid or not present, and credentials are present, the credentials will be used to authorize the machine towards the managed Altair Units system.
- In Option 1, the generated auth code is only valid for 15 minutes and you should restart your server within that timeframe to properly get access to your licenses.
- In Option 2, Altair One credentials are only required at first restart of the server to generate the auth token and should be removed from the `Panopticon.properties` file going forward to avoid exposing these credentials.
- A working Internet connection is required to use Altair Units licensing.
- If your company uses proxy, you might need to add exception in your proxy to allow

access to the Managed Altair Licenses.

Please refer to this link for more information:

https://community.altair.com/kb_view.do?sys_kb_id=bb9bf3fc97205590e3b0361e6253af03

Or see [Managed Altair Units License SSL Error](#) section below.

- If you don't have an Altair One account, you can sign up for a free trial that will allow you to test the product for 14 days.

Managing File Handles

In some cases, the Tomcat process that runs the Panopticon server may run out of file descriptors, which are handles used by the operating system to access a file (file handles). Panopticon data connections and license units checkouts count towards the total number of file handles in use.

When the maximum limit of file handles (open files) is reached, you cannot open any additional files, or make any additional TCP connections, or check out additional Altair license units.

On a Linux system, maximum file handles limit (open files) and other limits such as memory usage are called Resource Limits or `rlimits`. The `rlimit` values can be viewed and changed using the `ulimit` command and various arguments to that command. Please refer to Linux documentation for details on using the `ulimit` command, for example https://linuxhint.com/linux_ulimit_command/.

The system will have an overall limit (global system maximum) as set in the kernel variable file `/proc/sys/fs/file-max`. In addition, there are `rlimits` set for each process, or for each user running a process. The `rlimits` for any given process will have a soft limit and a hard limit. The soft limit is what will be in effect, and the hard limit says what the maximum is if you want to raise the soft limit.

The reason for setting `rlimits` specific for a process that are lower than the overall system `rlimits`, is that you want to economize system resources between several processes to ensure that no single process consumes all available system resources, thereby causing problems for other processes. Likewise, a process specific `rlimit` set lower than the system maximum is also useful for protecting the system, avoiding system total resource depletion.

Identifying the Problem

When a user encounters the maximum limit of file handles in Panopticon, data connection or logging into Panopticon could fail. To confirm that Panopticon has hit the file handle limit, you should look for this message in the Panopticon log:

(Err: 60) Out of file descriptors suitable for socket operation

In conjunction with the error message above, you may also see the following messages in the Panopticon log:

com.panopticon.server.core.exception.HyperWorksUnitsLicenseException: Unable to check out a license java.lang.Throwable: Altair License Manager: License error

Other things that could indicate that Panopticon has reached the maximum limit for file handles, but can also have other reasons, are:

- The browser console may show error messages like:
Unable to check out a license
- The dashboard may show the following message when you click the **Edit** button:
Unable to edit – HWU license error

- ❑ The dashboard may show the following when a Viewer wants to open a workbook:

AW Snap ! Unable to checkout license; Go to workbook overview

Enabling Event Poll to Avoid False Warnings

Altair Units License checkouts count towards the total number of open files. The Altair Units License SDK by default uses the **select(2)** interface in Linux to monitor the number of available file handles or sockets. The highest number that `select(2)` can return is **1024**. This means that as soon as 1024 or more file handles are open, the license server process will not see any available file descriptors.

However, the Altair Units License SDK can also use the **epoll(7)** interface in Linux, which is not suffering from the limitation of `select(2)`. To make the ALSDK use `epoll(7)` instead of `select(2)`, you must set an environment variable as follows:

LMX_USE_EPOLL=1

Still, `epoll(7)` is nonetheless bound by the `rlimit` settings, which means that in addition to setting the above environment variable, you may also need to raise the open files `rlimit` for the Tomcat process, by using the `ulimit` command.

CONFIGURATION PROPERTIES

Encoding

The default encoding of the JVM is the same as the system it is running on. It is recommended to configure your Java and Apache Tomcat to use the UTF-encoding. This is achieved by setting the property `file.encoding` to **UTF-8**.

There are several ways to configure the property and one method is to create a `setenv` file in your Apache Tomcat `bin` folder:

- ❑ `setenv.bat` for Windows
- ❑ `setenv.sh` for Linux

The following operating systems should contain the following information in order to use the UTF-8 encoding:

For Windows:

```
set JAVA_OPTS=%JAVA_OPTS% -Dfile.encoding=UTF-8
```

For Linux:

```
JAVA_OPTS="$JAVA_OPTS -Dfile.encoding=UTF-8"
```

- ❑ Restart the Apache Tomcat to save the changes.

PROXY

A proxy is a server or software running on a server that acts as an intermediary for requests from clients seeking resources from other servers. Instead of using a proxy, you can use a [load balancer](#).

It is recommended to use a proxy when setting up Panopticon Real Time. There are a variety of proxies available. One of the most commonly used proxies is Apache HTTP Server with the proxy module. Refer to the section below on how to setup an Apache HTTP Server with Proxy functionality.

Apache HTTP Server

This section describes the steps on how to install and configure an Apache Proxy. The guide expects that the Apache HTTP Server is being setup for the first time. Please note that the installation steps might vary depending on your environment. These steps cover how to install and configure an Apache HTTP Server with proxy support for Microsoft Windows.

1. Download the Apache HTTP Server from the official webpage: <https://httpd.apache.org/download.cgi>
2. Unzip and copy the files to a folder.
3. Configure the proxy by opening the `httpd.conf` file in the `conf` folder.
4. Update the `SRVROOT` variable. The value must be updated to the file location of the Apache HTTP server.

```
Define SRVROOT "/Path/To/Apache"  
ServerRoot "${SRVROOT}"
```

5. Modules are required to be loaded to make the Apache HTTP Server into a proxy. Add the following lines in the `httpd.conf` file.

```
LoadModule proxy_module modules/mod_proxy.so  
LoadModule proxy_http_module modules/mod_proxy_http.so  
LoadModule proxy_wstunnel_module modules/mod_proxy_wstunnel.so  
LoadModule rewrite_module modules/mod_rewrite.so
```

NOTE

In the `httpd.conf` file:

- Ensure that the line `Include conf/extra/httpd-vhosts.conf` is uncommented.
- Replace `Listen 80` with `Listen 10088`.

6. Configure the logic for the proxy and how requests should be passed. The Virtual host config should look like this and be added to the `httpd-vhosts.conf` file in the `conf/extra` folder:

```
<VirtualHost :10088>  
  ServerAdmin webmaster@localhost  
  ProxyPreserveHost On  
  ProxyPass /panopticon http://localhost:8080/panopticon  
  ProxyPassReverse /panopticon http://localhost:8080/panopticon  
  ProxyPass /panopticon/server/ws http://localhost:8080/panopticon/server/ws
```

```
ServerName localhost:8080
RewriteEngine on
RewriteCond %{HTTP:UPGRADE} ^websocket$ [NC]
RewriteCond %{HTTP:CONNECTION} Upgrade [NC]
RewriteRule . ws://localhost:8080%{REQUEST_URI} [P]
</VirtualHost>
```

7. The Apache HTTP Server can be started when all the configurations are in place. This is done by running the `httpd` script or application in the Apache `bin` folder.

LOAD BALANCER

A load balancer is a server used to distribute the workload across multiple computer resources. A load balancer allows you to scale the system to max and optimize the resource use and throughput, and at the same time minimize the response time. A load balancer can also be used to ensure that the system will still be available, even during downtime on a computer resource.

Very much like proxies, there are a variety of load balancers available. The only requirement Panopticon Real Time has on the load balancer is that it supports persistence or stickiness. This means that the proxy will establish a user session and ensure that the user continues to use the same computer resource.

Stickiness is mainly implemented in two means: **Cookies** or **URL encoding**. These two alternatives will be used to determine which route the user will continue to take in the load balancer. The rest of this section will cover how to implement stickiness with cookies.

Sticky load balancer that are using cookies are normally using session tokens. Due to this, it is required to configure Panopticon to use session tokens. This is done by updating the following property to **SESSION** in the `Panopticon.properties` file: `authentication.token.persistence`.

```
authentication.token.persistence=SESSION
```

IMPORTANT

After modifying the property value to `SESSION`, ensure to clear the `AppData/Token` folder before starting the server.

For details on how to configure multiple servers to run in a cluster and synchronize content between them, see [Server Cluster Configuration](#).

Apache HTTP Server

The following section describes the steps on how to install and configure an Apache Load Balancer. The guide expects that the Apache HTTP Server is being setup for the first time. Please note that the installation steps might vary depending on your environment. These steps cover how to install and configure an Apache HTTP Server with proxy support for Microsoft Windows.

1. Download the Apache HTTP Server from the official webpage: <https://httpd.apache.org/download.cgi>
2. Unzip and copy the files to a folder.
3. Configure the proxy by opening the `httpd.conf` file in the `conf` folder.

4. Update the `SRVROOT` variable. The value must be updated to the file location of the Apache HTTP server.

```
Define SRVROOT "/Path/To/Apache"  
ServerRoot "${SRVROOT}"
```

5. Modules are required to be loaded to make the Apache HTTP Server into a load balancer. Add or uncomment the following lines in the `httpd.conf` file.

```
LoadModule proxy_module modules/mod_proxy.so  
LoadModule proxy_http_module modules/mod_proxy_http.so  
LoadModule proxy_wstunnel_module modules/mod_proxy_wstunnel.so  
LoadModule rewrite_module modules/mod_rewrite.so  
LoadModule headers_module modules/mod_headers.so  
LoadModule lbmethod_byrequests_module  
modules/mod_lbmethod_byrequests.so  
LoadModule proxy_balancer_module modules/mod_proxy_balancer.so  
LoadModule slotmem_shm_module modules/mod_slotmem_shm.so
```

6. Configure the logic for the load balancer and how requests should be passed.

In the following example, we have configured the load balancer to listen to port **10080** and to use two balancer members (**Route 1** and **Route 2**). The example will also set a session cookie named **ROUTEID**. The cookie contains the route that the user took and will continue to use throughout the active session.

```
<VirtualHost *:10080>  
  ServerAdmin webmaster@localhost  
  ProxyPreserveHost On  
  
  Header add Set-Cookie "ROUTEID=.%{BALANCER_WORKER_ROUTE}e; path=/"  
  env=BALANCER_ROUTE_CHANGED  
  
  <Proxy "balancer://panopticoncluster">  
    BalancerMember "http://localhost:8080/panopticon" route=1  
    BalancerMember "http://localhost:8081/panopticon" route=2  
    ProxySet stickysession=ROUTEID  
  </Proxy>  
  
  ProxyPass /panopticon balancer://panopticoncluster  
  ProxyPassReverse /panopticon balancer://panopticoncluster  
  
  ServerName localhost:8080  
</VirtualHost>
```

7. The Apache HTTP Server can be started when all the configurations are in place. This is done by running the `httpd` script or application in the Apache `bin` folder.

MULTIPLE INSTANCES

Multiple instances of Panopticon Real Time can be deployed onto a single machine.

The common usage models for multiple instances are:

- Multi-tenant deployments, providing separate **Sand boxes** for each tenant
- Multi environments (Development, Test, Production)
- Regression Testing

- To deploy multiple servers, the WAR and corresponding configuration file must be updated to have a unique name.

BACKUP

Panopticon Real Time consists of:

- Software Installation & Server Configuration
- License
- Usage Configuration
- Published Workbooks
- Data
- Caches

Backup is typically divided into the above sections, with published workbook backup occurring on a regular basis from the configured AppData (i.e., `c:\vizserverdata`) folder.

DATA ACCESS AND CACHING

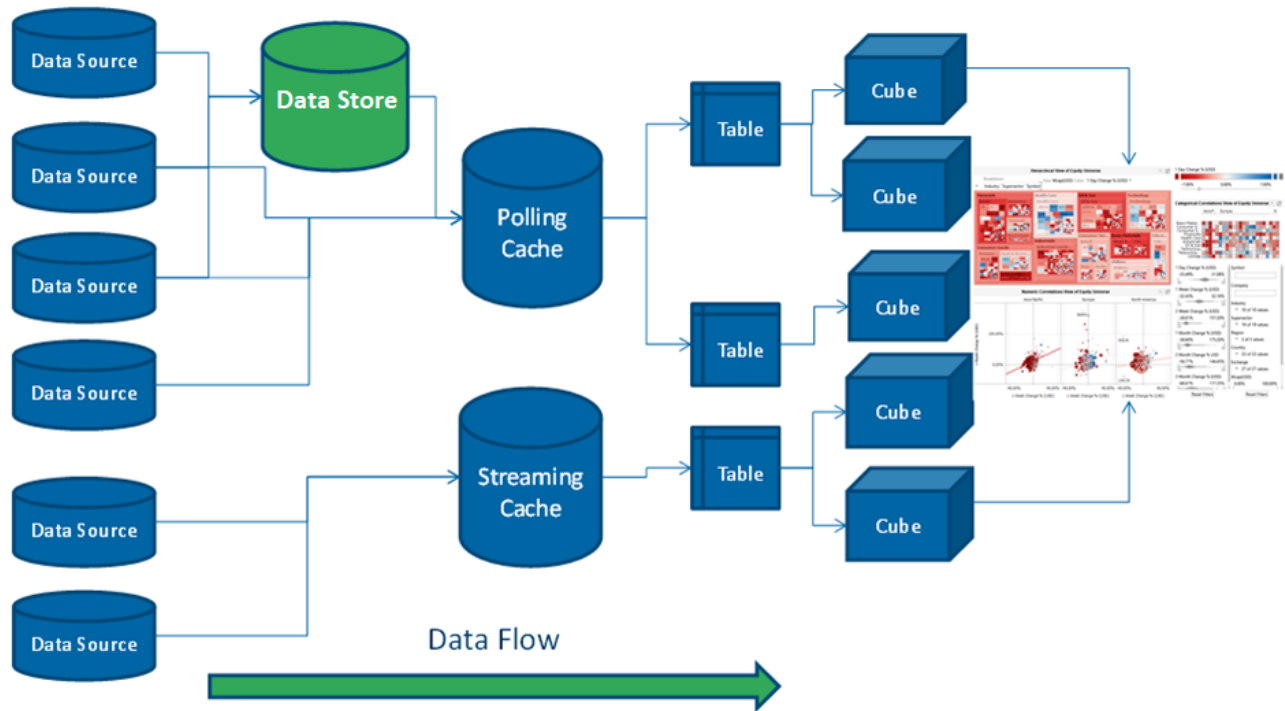

Panopticon assumes in general that data is never at rest and too big to be simply loaded into memory. The data can either be subscribed against or polled (automatically refreshed on a defined period).

This means either:

- Load Subset of Data in Memory
- Load Summary and Parameterized Detail Views
- ROLAP (Dynamically explore datasets)

Consequently, for direct access, Panopticon is only as fast as the underlying data platform, or the refreshing of result set caches.

When data is not changing on a timely basis, such as a daily updated data warehouse, there is the additional option of retrieving data into a data store.

Consequently:

- Only required data is retrieved. Majority of the data stays in the underlying data sources.
- Typically aggregated, conflated, filtered data is retrieved.
- Behind each dashboard part (visualization) is a micro-cube.
- Each cube is designed for streaming real time updates.
- Behind each cube is a real-time data table (also powering filters).
- Behind each data table is a resultset cache.
- Behind the cache is the underlying data repository.
- Caches can be loaded on the fly, or pre-loaded on a periodic basis.
- All caching is optional.
- Consequently, data access is either:
 - **Work Directly** against underlying sources (either Exploratory Analysis (ROLAP), Or Pre-Defined Parameterised Views)
 - Import data into the Data Store

Usage is typically **Hybrid**. Based on the characteristics of the underlying data, you choose whether to import to Data Store, or query directly.

This is to cater for real world data landscapes, where different data has different data retrieval latency characteristics, and different timeliness; and where there is too much data to simply load all into memory.

CONTENT REPOSITORY

Previous versions of the server stored workbook files in the `Workbooks` subdirectory of the application data directory (i.e., `c:\vizserverdata\Workbooks`), and older versions of those workbooks in the `Archive` subdirectory (i.e., `c:\vizserverdata\Archive`). Starting with the 2020.0 release, workbooks are now stored in a version tracking repository, located in the `.repository` subdirectory (i.e., `c:\vizserverdata\.repository`).

The repository also stores other types of content that was previously stored in separate subdirectories of the application data directory, such as data files and bookmarks.

The new workbook repository tracks changes to content, folders, and permissions. It also makes it possible for multiple servers to synchronize their repositories, so you only have to make changes to a workbook on one node in a server cluster, and it will automatically propagate to the other servers [see section on [cluster configuration](#)].

The first time you start the 2020.0 server, it will initialize an empty repository in the application data directory. If you are upgrading an existing install, you have the option of migrating content from the old application data directory into the new repository [see section on [content migration](#)].

For the list of properties that control the repository behavior, refer to those starting with `'repository.'` in the [Properties: Panopticon](#) section.

SERVER CLUSTER CONFIGURATION

When you have multiple servers running, you can set them up so they synchronize content between them. The servers will use an internal protocol over `http(s)` to propagate changes and make sure their content is the same.

The cluster component discovers the other servers and the topology that connects them and can use various methods to do so. The cluster component also identifies one of the running servers as the **leader**, the others are **followers**.

The leader-follower relationship determines how content is synchronized. A follower will immediately push any local change to the leader, for example, when you save a workbook after editing it. On the other hand, a follower periodically polls the leader for changes. This means the leader has the "latest" version of the content, whereas a follower may lag behind by a few seconds. The leader is also special if there are conflicting changes, for example, if two users edit and save the same dashboard. In this case, the leader's changes always win.

The REST services, that the servers call to synchronize content, expose potentially sensitive information such as data tables and data source settings. They are protected by token validation just as other services on the server, and only accepts special "server" tokens that are never issued to users. A server can only get a token from another server if they have both been configured with the same shared secret. That said, the calls are not encrypted, so if you connect two servers over the internet, you will want to use HTTPS.

Even though the content synchronization makes it easier to run a set of servers as a cluster behind a load balancer, you still need to use sticky sessions (session affinity). The server requires that a single user stays with the same server instance for the duration of a session.

There are four different cluster modes:

- None** - Each server is completely stand-alone, and nothing will be synchronized. This is the default, and no further configuration is needed.
- Fixed** - One server is the permanent leader. The other servers will synchronize with it if it is up. If the leader goes down, the followers will log the problem, but will continue to run basically as stand-alone servers. When the leader comes back up, they will start synchronizing again.

In practice, the fixed mode has a single point of failure. Because the followers connect through the leader, even if they keep running, their content will not be synchronized, and conflicts become more likely the more their content diverge.

To configure fixed mode, set `cluster.shared.secret` to the same non-empty string on all, set `cluster.mode` to **FIXED** on all, and then set `cluster.fixed.leader` to the URL of the leader on the followers only (leave it blank on the leader).

The leader URL should be the path to the web application, for example `http://panoserver:8080/panopticon/`. It needs to identify the leader server and be resolvable on the network that the followers run on. If you use a load balancer, you cannot use the externally exposed URL, as it always needs to resolve to the leader server. If the leader server is dynamically assigned an IP, you need to take extra steps to assign it with a URL that does not change.

- ❑ **Bully** - The server with the lowest ID (lexicographically) of the running servers is chosen as leader, and if it goes down a new leader is automatically appointed.

When a new server joins a bully cluster, it needs to discover the current list of members and their IDs. To do this, it tries to contact any running server from a list of known servers, called the boot servers. If any one of them answers, it replies with the current members and leader. If none of them answers, it starts as the single member of the cluster if it is one of the boot servers, or refuses to start if not.

In a sense, the bully mode is more flexible than the fixed mode, since it eliminates the single point of failure. As long as one server is still running, there will be a leader, so synchronization will happen. In another sense, it's less flexible as you need to provide more non-changing URLs, one for each server.

To configure the bully mode, set `cluster.shared.secret` (see above), set `cluster.mode` to **BULLY** on all, set `cluster.bully.id` to a unique ID string for each server (lower ID has higher leader priority), set `cluster.bully.bind` on each to the URL on which the other servers can reach it, and `cluster.bully.boot` to a comma-separated list of known server URLs.

An example bully configuration with three servers:

On server #1:

```
cluster.shared.secret=supersecretpassword
cluster.mode=BULLY
cluster.bully.id=panopticon-1
cluster.bully.bind=http://192.168.0.10/panopticon
cluster.bully.boot=\
http://192.168.0.10/panopticon,\
http://192.168.0.11/panopticon
```

On server #2:

```
cluster.shared.secret=supersecretpassword
cluster.mode=BULLY
cluster.bully.id=panopticon-2
cluster.bully.bind=http://192.168.0.11/panopticon
cluster.bully.boot=\
http://192.168.0.10/panopticon,\
http://192.168.0.11/panopticon
```

On server #3:

```
cluster.shared.secret=supersecretpassword
cluster.mode=BULLY
cluster.bully.id=panopticon-3
cluster.bully.bind=http://192.168.0.12/panopticon
cluster.bully.boot=\
http://192.168.0.10/panopticon,\
http://192.168.0.11/panopticon
```

Note that only servers #1 and #2 are boot servers, and that only id and bind differ between servers. With this configuration, servers #1 and #2 can be started in any order, but at least one of them must be up before #3 starts. On the other hand, you can add server #3 without #1 and #2 knowing about it up front, so non-boot servers can be useful in auto-scaling scenarios.

One caveat with non-boot servers is that if all the boot servers go down, a non-boot server will become the leader. If a new server joins, or a boot server rejoins, there is now way for them to see this, and you will end up with two separate clusters.

- **Kubernetes** - The servers discover each other through the Kubernetes API Server, and the one whose pod has the lowest name (lexicographically) is chosen as leader. Each server periodically refreshes this information, so if the list of available pods change, they adapt.

To call the Kubernetes API, the server needs to know the address of the API Server and also have valid credentials. By default, the address is passed into the pod via Kubernetes downward API as environment variables `KUBERNETES_SERVICE_HOST/PORT`, and the credentials are mounted to `/var/run/secrets/kubernetes.io/serviceaccount/`, and the server will use these, so no extra configuration is needed.

The server discovers the other servers (pods) with a Kubernetes label selector. You can use any label and any selector for this, e.g., give each pod the metadata label "app" with value "panopticon" and use the selector "app=panopticon". The server will assume that all pods returned by the query are standard Panopticon servers.

You also need to tell each server what its own pod name is, so it can tell if it's supposed to be a leader or follower and avoid calling itself. You can use the Kubernetes downward API to pass this in: use `valueFrom`, `fieldRef` and `fieldPath` "metadata.name" (see example below).

To configure the Kubernetes mode, set `cluster.shared.secret` (see above), set `cluster.mode` to **KUBERNETES**, set `cluster.kubernetes.id` to the pod's name, set `cluster.kubernetes.label_selector` to the pod selector, and `cluster.kubernetes.peer_path` to the web application path.

If the pod that runs the Panopticon server container also runs other containers, the first container will be used. If this is not the case, you can set `cluster.kubernetes.container_name` to the name of the container that runs the Panopticon server.

Example yaml snippet:

```
template:
  metadata:
    labels:
      app: panopticon
  spec:
    containers:
      ...
    env:
      - name: CLUSTER_SHARED_SECRET
        value: supersecretpassword
      - name: CLUSTER_MODE
        value: KUBERNETES
      - name: CLUSTER_KUBERNETES_ID
        valueFrom:
          fieldRef:
            fieldPath metadata.name
      - name: CLUSTER_KUBERNETES_LABEL_SELECTOR
        value: app=panopticon
      - name: CLUSTER_KUBERNETES_PEER_PATH
        value: panopticon/
```

SYNCHRONIZING TOKENS

When a user has authenticated successfully with a server, a token is issued that is passed back and forth in a cookie. These tokens may be long-lived with a default expiration time of seven days and normally automatically reissued. So when the server is regularly used, the user will rarely need to log in again. Similarly, API tokens never expire.

Normally, a token issued by one server is only valid on that server. The server keeps track of issued tokens and validates each incoming token against its stored tokens. Furthermore, tokens are revoked when an administrator logs out a user, and the token is removed from the server's list.

If there are multiple servers that is being used as a cluster with a load balancer in front, they should be configured to have synchronized tokens. Even if the load balancer uses sticky sessions as it should, a token is typically valid for a longer time than a session lasts, and the user should not have to log in again just because a new session is directed to a different server than last time.

Token synchronization uses a different mechanism from repository synchronization. The repository stores content with its change history, and there are scenarios where the user may want to synchronize one and not the other. For example, there may be one QA server and one production server then use a common login.

Tokens are synchronized through the cluster shared store. By default, this is just a subdirectory `<appdata>/shared/` which is not synchronized. The store also keeps other types of non-content data that the user may want to synchronize between servers.

To enable token synchronization:

- Change the property `cluster.shared.store.type` from its default **PRIVATE_DIRECTORY** to **SHARED_DIRECTORY**.
- Set `cluster.shared.store.shared_directory.path` to a location that is accessible from all servers. On Kubernetes, this would typically be a volume that you mount on a path in the container.
- Ensure all servers use the same cookie name in `authentication.token.cookie`, or a cookie issued by one server would not be visible to another.
- Ensure all servers (i.e., validating server and the one that issued the token) have the same `authentication.token.secret`. This secret is used to sign and validate tokens.

EXPORTING LEGACY FILES

Starting with Panopticon 2020.0, new server installation will no longer include `Workbooks` and `Data` folders in the `AppData` folder. To recreate these folders and export workbooks and their associated data files, `GroupAccessRestrictions`, and parameters that are stored inside the repository, you can either:

- do a POST call to `http://[host]:[port]/[serverappname]/server/rest/server/export/legacy/files?replaceExistingDataFiles=true&replaceExistingWorkbooks=true`

Example:

```
http://localhost:8080/panopticon/server/rest/server/export/legacy/files?replaceExistingDataFiles=true&replaceExistingWorkbooks=true
```

- or perform the following steps

1. Set the `documentation.enabled` property in [Panopticon.properties](#) to **true**.

```
documentation.enabled=true
```

2. Restart the server.
3. Access the REST API to call the `/rest/server/export/legacy/files` service using this URL:
`http://[host]:[port]/[serverappname]/swagger-ui.html`
Example: `http://localhost:8080/panopticon/swagger-ui.html`
The Panopticon REST API page displays.
4. Select **legacy** in the *Select a Definition* drop-down list.
5. Expand the *Server* section and find the **Export Legacy Files** service then run it.
If successful, the `Data` and `Workbooks` folders are recreated in the `AppData` folder with the exported workbooks, data files, parameters, and `GroupAccessRestrictions`.

UPGRADING PANOPTICON REAL TIME

The server stores all its content in the `AppData` (e.g., `c:\vizserverdata`) directory. Ensure that you back up this directory frequently. You can always revert the server to an earlier state by restoring the entire `AppData` directory from a backup.

In general, a newer server will use an `AppData` from an older server, with exceptions for some types of content that you may need to migrate manually. In contrast, the server will refuse to start if you point an older server to an `AppData` that has been used with a newer server.

NOTE Two servers should never share the same `AppData` directory.

It is recommended that you try out the new server version with your existing content before you decide to upgrade. The best way to do this is on a dedicated server machine, or at a minimum on a separate Tomcat instance. You should use a separate `AppData` directory for the new server while you are evaluating it --- if for some reason you decide to wait with the upgrade, you will not be able to use the new version's `AppData` on the old server, even if you have not made any changes.

Summary of steps:

1. Make a full backup of the old server's `AppData` directory.
2. Configure a new Tomcat, ideally on a separate machine.
3. Put the new server WAR file in the new Tomcat's `webapps` directory.
4. Copy the entire `AppData` from the old server to the new server.
5. Make sure the new server is pointed at the new `AppData` copy.
6. Read [below](#) for how content is migrated between versions.
7. Start the new server and then review its log file carefully to see if there were any warnings related to migration.
8. Try out the new server. Keep in mind that content created or changed on the new server cannot be moved back to the old server if you decide to roll back.
9. If you have continued to use the old server in parallel with testing, you should copy over the `AppData` again to make sure you have the latest content.

Content Migration

The format of the `AppData` changes between versions. Certain types of content may be moved to a different location with the `AppData` e.g., bookmarks from loose files into the repository for version tracking and cluster replication. Frequently, new features may be added to the content which may include changes to the content models, e.g., workbooks with new property. Typically, a newer server version will do this migration behind the scenes when it first starts up, and any issues found will be logged with at least a warning level.

NOTE After starting a new server version for the first time, check the log file for warnings. It is much easier to address these issues immediately than later on, for example, if you wish to redo a one-time migration step.

By default, the server will check for content in an old location in `AppData` and do a one-time migration of anything it finds when it starts. Typically, the server will copy old content from loose files into the repository. This type of migration is controlled through the `repository.migrate.<type>.path` properties in [Panopticon.properties](#).

For example, in versions 21.1 and older, the server stored workbook bookmarks as loose files in the `AppData/Bookmarks/` directory. Version 21.2 stores them inside the repository in `AppData/.repository/` instead. The property `repository.migrate.bookmarks.path` defaults to **Bookmarks** which is relative to `AppData` and therefore points to the 21.1 bookmark files. When the 21.2 server starts, this can happen:

- ❑ There are no bookmarks in the repository but are available in `AppData/Bookmarks/` or to some other location you have set the property to. The server will do a one-time migration and move them into the repository. The result of this will be logged. The old bookmark files are left in the old location but will no longer be used.
- ❑ There are bookmarks in the repository. You may have created them on the new server, or the migration has run already. In this case, it does not matter if the old location has bookmarks or not, and the server will log a warning that it will not run a second migration. To get rid of the warning, simply blank out the property value.
- ❑ There are no bookmarks in either location, but the property is still set. This would be the default on a new server. In this case, you will get a false migration warning because the server cannot find `AppData/Bookmarks/`. Again, just blank out the property value to get rid of the warning.

NOTE

- Because the server will not migrate a type of content (e.g., bookmarks) if that type of content is already in the repository, you will need to delete the repository to run the migration again. The easiest way is to start over with the `AppData` from the old server.
- After the content has been migrated, the original files are left in the old location in `AppData`. They are no longer used, to clean up, you may want to delete them after you have checked the logs for any migration issues.

There are some types of content that have changed so much between releases that they cannot be automatically migrated like this.

Workbooks and their history in version 17 and older were stored separately in `AppData/Workbooks/` and `AppData/Archive/`. You can use the `repository.migrate.workbooks.path` and `repository.migrate.archive.path` properties to migrate them, but we do not default these to the old locations (e.g., you may not want to migrate the entire history), and for clarity you need to use absolute paths if you set them.

Data files used with text data sources can now optionally be stored in the repository so they can be bundled with the workbook, and replicated to other servers in a cluster. You can still have data files in `AppData/Data/`, so old workbooks will continue to work on new servers, but old files are not automatically migrated into the repository.

Permissions on workbook folders were in version 17 and older stored in XML files in the `AppData/Workbooks/` subtree. The permissions model has changed completely since then, so they are not automatically migrated. To migrate permissions from version 17, you need to:

1. Use PCLI [convertpermissions](#) to create a permissions template which, as closely as possible, reflects the old permissions. This is a single JSON file which the new server can apply to its repository.
2. Review the generated permissions template in a text editor to make sure it is correct.
3. Point the `repository.startup.apply.permissions.path` to the template file and start the server. You can control how the template is applied with the properties `repository.startup.apply.permissions.clean` and `repository.startup.apply.permissions.create`.
4. Clear the properties after the server has started, or they will be applied on each startup overwriting changes you make.

NOTE In version 17 and earlier, the files `AppData/Administrators.txt` and `AppData/AdministratorsGroup.txt` were used to give users administrative permissions. Currently, with the normal permissions model, these files are no longer used.

Authentication tokens are server-specific. They will only work on a new server if it has the same `authentication.token.secret` value as the old server that created them. In addition, a normal user token is also stored as cookie in the user's browser and will only get sent to a new server if it has the same URL as the old server. For these reasons, tokens are not automatically migrated, and users will have to log in again.

The exception to token migration is API tokens. In version 21.1 and older, these were stored in `AppData/APIToken/`. In 21.2, all tokens, including the API tokens, are stored in the shared cluster storage (even if you only have one single server), by default in `AppData/shared/tokens/`. See also the section on [Synchronizing Tokens](#). If the server finds API tokens in the old location, they will be migrated on startup.

[3] AUTHENTICATION

INTRODUCTION

Panopticon Real Time provides multiple approaches on authentication. It can easily be configured to use different authentication mechanisms depending on the environment and the setup. The server only supports authentication and authorization and does not have any support for user management or administration of users.

There are mainly two properties that manage the authentication on the server. These properties are listed and described in the table below. Please note that more properties might need to be configured depending on the authentication mechanism you are using.

Property	Description	Default value
authentication.role	The required role or group that the user needs to be identified as a Panopticon user. The property can be left blank if no role or group is required.	
authentication.required	This property will make the authentication required. It will force the user to login in order to use any of the services provided by the server.	true
authentication.type	The type of authentication that should be used when authenticating the user. The property allows the following values: BASIC , FILTER , HEADER , OAUTH2 , SAML , WINDOWS .	BASIC
authentication.domain	The default domain information for user authentication.	

Depending on the authentication or user management mechanism used, the role that a user should have is specified and then mapped to a group set in [Panopticon.properties](#).

Property	Description	Default Value
access.administrator.groups	The role that is mapped to the administrator group.	admin
access.default.roles	The default roles applied to all users of the server. For example, if <code>access.default.roles=DESIGNER,ADMINISTRATOR</code> and a user with a VIEWER role logs on to the server, then the user will simultaneously have a VIEWER, DESIGNER, and ADMINISTRATOR roles. A blank value for <code>access.default.roles</code> is equivalent to ANONYMOUS. A blank value or the value ANONYMOUS will NOT block users from authenticating. NOTE: The roles that can be assigned in this property can only be ADMINISTRATOR, VIEWER, ANONYMOUS, and/or DESIGNER. This property is case sensitive.	VIEWER
access.designer.groups	The role that is mapped to the designer group.	designer
access.viewer.groups	The role that is assigned to the viewer group.	

NOTE

- Group sets can be added for a role, separated by a comma.
- To be able to use all of the features of Panopticon Real Time, a user is required to have Designer and Administrator roles.
- When using [Altair Units licensing](#), different user roles will check out different numbers of Altair Units.

Role	Altair Unit Draw
Viewer	2
Designer	2 21 when designing a workbook
Administrator	2

Normally, you should use role mapping to control user access. This way you can manage access in the same place that you manage your users without having to reconfigure the server.

In some scenarios, it may be impossible to set up appropriate roles for Panopticon in your external system, or you may want to make one-off exceptions for specific users. As a workaround for these cases, you can also explicitly list individual users and their access in the server configuration with the [access.administrator.users](#), [access.designer.users](#), and [access.viewer.users](#) properties.

Configuring Which Users are Allowed to Log On to Panopticon

When `access.default.roles` is set to blank (nothing), it is equivalent to setting it to the role **ANONYMOUS**. This means that, authenticated users will get the role **ANONYMOUS** when they don't have any of the roles that give them any of the following capabilities such as **VIEWER**, **DESIGNER**, or **ADMINISTRATOR** in Panopticon. The role **ANONYMOUS** in practice gives a user **VIEWER** capabilities in any folders where "Everyone" is allowed to read.

This means that setting `access.default.roles` to blank is NOT a valid way of preventing users from successfully authenticating and getting access to Panopticon. It is only related to default authorization of users, while it does not affect authentication.

In an organization where only selected users should have access to Panopticon, as opposed to letting any existing user have access, one of the following approaches should be taken:

a. The authentication approach (preferred)

Configure the authentication layer integration to specify which group memberships are required to be allowed to authenticate, so that only users to whom you intend to give access to Panopticon are allowed to authenticate. For example, when using LDAP, add a `userPattern` specification of an OU (Organizational Unit) that is allowed to authenticate in the Realm configuration.

b. The content access control approach (use only if option **a** is unavailable)

Change the general content access control on Panopticon by changing the settings on its root folder, so that the role names associated with **VIEWER** and **DESIGNER** capabilities are listed as Allowed to Read and remove "Everyone" from the *Allowed* section. (**NOTE:** Users with roles that are associated with **ADMINISTRATOR** capability will always have access to all folders.) The disadvantage of using this approach is, any existing user will still be able to successfully authenticate and view any content where "Everyone" is allowed to read.

Token

A web token is used when the user has successfully logged into Panopticon Real Time when using one of the following authentication types: **BASIC**, **SAML**, or **WINDOWS**. The token is used to identify the user and represent the user's ongoing session. This is done to prevent user credentials being sent between the user and server more than necessary.

The token is returned from Panopticon Real Time in the form of a cookie when the user has been authenticated. By default (false), the cookie will be stored in the browser as https cookie and is accessible to the JavaScript.

The token can be configured differently to suit your needs and requirement. The token can be configured to be valid at a certain amount of time, if it can refresh itself, if it should be persistent or if it should only last for a user session (while the browser is still open), and/or it can be stored as a HttpOnly cookie. All this can be configured in the `Panopticon.properties`. The table below lists all available token properties.

Property	Description	Default Value
<code>authentication.token.persistence</code>	This property is used to determine if the token should persist if the browser is closed or if it should only last while the browser is open. There are two possible values: PERSISTENT and SESSION . PERSISTENT will persist the token in the browser even if the browser has been closed and reopened. SESSION will remove the token from the browser if it is shutdown. IMPORTANT: After modifying the property value to SESSION , ensure to clear the <code>AppData/Token</code> folder before starting the server.	PERSISTENT
<code>authentication.token.refreshable</code>	This property determines if the token can refresh itself. The Web client can identify if the token is about to expire and then request a new token with the existing token. A token is refreshable if the property is set to true . The token will expire and invalidate the user session if the property is set to false .	true
<code>authentication.token.secret</code>	The secret is used to sign the token. The secret will be auto generated when the server starts for the first time. NOTE: <i>This value should be kept a secret.</i>	Auto-generated
<code>authentication.token.validity.seconds</code>	The number of seconds that the token should be valid.	604800
<code>authentication.token.cookie</code>	The name of the cookie used to store the authentication cookie. Must be unique for each server instance on the host.	ptoken
<code>authentication.token.cookie.httponly</code>	This property determines how the browser will treat the cookie. If set to true , the cookie will be stored in the browser as a HttpOnly cookie and will not be available to the JavaScript. If set to false (default), the cookie will be stored in the browser as https and will be accessible to the JavaScript.	false
<code>authentication.token.cookie.secure</code>	This property determines how the browser will treat the cookie depending on the security of the connection. If set to true , when the browser	false

	receives a secure cookie (HttpOnly cookie), you will not be able to transmit it unless the connection is secure.	
authentication.token.in.login.response.body	This property determines if the REST login response body should contain a token info. NOTE: Does not affect the SOAP login response body.	false

TOMCAT REALM

Panopticon Real Time can be configured to use the Tomcat Realm when performing authentication. The Tomcat Realm is configured in the `server.xml` file in the Tomcat `conf` folder. The Tomcat Realm itself can be configured to authenticate towards a variety of different types of authentication source, such as Tomcat user base and LDAP. The sub chapters in this chapter will give examples on how to configure the Tomcat Realm.

Panopticon Real Time needs to be configured to use the BASIC type in order to do the authentication towards the Tomcat Realm. To enable Tomcat Realm authentication, set this property in the `Panopticon.properties` file:

```
authentication.type=BASIC
```

NOTE

- Reading the Apache Tomcat documentation is recommended: <https://tomcat.apache.org/tomcat-9.0-doc/realm-howto.html>. Abbreviations used: CN = Common Name, OU = Organizational Unit, DC = Domain Component.
- It is a common approach to wrap your Tomcat Realm with the LockOutRealm. This is used to prevent brute-force attacks.

```
<Realm
className="org.apache.catalina.realm.LockOutRealm">
  <!--Insert your own Tomcat Realm here -->
</Realm>
```

Tomcat User Base

The Tomcat User Base Realm is using a JNDI resource to store user information. By default, the JNDI resource is configured in an XML file. The default file is `tomcat-users.xml` in the Apache Tomcat `conf` folder.

We strongly recommend using this authentication approach for your test or local environment. It is easy to setup and configure. However, it is not designed to be used for large-scale production or when you have a large number of users.

The following Realm should be added in the `server.xml` file in the Apache Tomcat `conf` folder:

```
<Realm className="org.apache.catalina.realm.UserDatabaseRealm"
resourceName="UserDatabase"/>
```

NOTE

The Tomcat User Database Realm is used as the default. No configurations are

required in the `server.xml` file to be able to use the Tomcat Database Realm.

The users and roles are managed in the `tomcat-users.xml` file in the Apache Tomcat `conf` folder. In this file, you can add users and roles as well as assign roles to users.

Example 1

Add the following role and user to your `tomcat-users.xml` file:

```
<role rolename="administrator"/>
<user username="James" password="james" roles="administrator"/>
```

By adding these two lines you have achieved the following:

- Created a new role named **administrator**
- Created a new user with username **James** and password **james**
- Assigned the newly created user the role **administrator**

Example 2

```
<role rolename="admin"/>
<role rolename="designer"/>
<role rolename="user"/>
<user username="viewer" password="viewer" roles="user"/>
<user username="John" password="john" roles="user,admin"/>
<user username="Paul" password="paul" roles="user,designer"/>
<user username="Austin" password="austin" roles="user,designer,admin"/>
```

By adding these seven lines, you have achieved the following:

- Created three new roles named **admin**, **designer**, **user**
- For the role **user**, created four users:
 - with username **viewer** and password **viewer**
 - with username **John** and password **john**
 - with username **Paul** and password **paul**
 - with username **Austin** and password **austin**
- For the role **admin**, created two users:
 - with username **John** and password **john**
 - with username **Austin** and password **austin**
- For the role **designer**, created two users:
 - a user with username **Paul** and password **paul**
 - with username **Austin** and password **austin**

NOTE

User Austin has both administrator and designer roles and is considered a super user.

A sample `tomcat-users_example.xml` is provided in the `AltairPanopticonVisualizationServerWAR_<version number>.zip` file. You can modify or add new users and roles in this file.

In Panopticon 2020 and onwards, the `Administrators.txt` and `AdministratorGroup.txt` files are no longer used to authorize administrator users. The function provided by these files has been replaced by a set of properties in [Panopticon.properties](#):

```
access.default.roles=VIEWER
access.administrator.groups=admin
access.designer.groups=designer
access.list.delimiter=,
access.viewer.groups=
```

The `access.default.roles` property defines the default roles assigned to any user accessing the server, defaulting to VIEWER. The administration (`access.administrator.groups` property) and content creation (`access.designer.groups` property) on the server are mapped by default to the admin and designer user groups.

Group sets can be added for a role, by default separated by a comma.

Encrypting Passwords in tomcat-users.xml

Tomcat supports encrypted user credentials via the Digested Passwords feature:

https://tomcat.apache.org/tomcat-9.0-doc/realm-howto.html#Digested_Passwords

To secure passwords saved in `tomcat-users.xml`, do the following:

1. Stop Tomcat.
2. Open `[tomcat_home]/conf/server.xml`.
3. In `server.xml`, find the Engine XML element.

Nested inside the Engine element, there is a Realm element named `LockOutRealm`. Nested inside the `LockOutRealm` is another Realm element named `UserDatabaseRealm` that looks like this:

```
<Realm className="org.apache.catalina.realm.UserDatabaseRealm"
        resourceName="UserDatabase"/>
```

4. Edit the `UserDatabaseRealm` element into the following:

```
<Realm className="org.apache.catalina.realm.UserDatabaseRealm"
        resourceName="UserDatabase">
  <CredentialHandler
    className="org.apache.catalina.realm.MessageDigestCredentialHandler"
    algorithm="SHA-256"/>
</Realm>
```

NOTE

You must add the closing element “</Realm>” for the `UserDatabaseRealm` and edit out the closing forward slash “/” at the end of the original `Realm` element.

5. Generate hash from plain text passwords using the command below:

Linux example:

```
[tomcat_home]/bin/digest.sh -a SHA-256 -h  
org.apache.catalina.realm.MessageDigestCredentialHandler [password]
```

Windows example:

```
[tomcat_home]/bin/digest.bat -a SHA-256 -h  
org.apache.catalina.realm.MessageDigestCredentialHandler [password]
```

NOTE

If your Apache Tomcat installation has the `JAVA_HOME` environment variable set only in the file `catalina.sh` (Linux) or `catalina.bat` (Windows) and not generally on the system, you will also need to set the `JAVA_HOME` variable before running the digest command.

Linux example:

```
export JAVA_HOME=/path/to/JavaInstallation
```

Windows example:

```
set JAVA_HOME=/path/to/JavaInstallation
```

The digest command will return the password supplied, followed by a colon, and then a hash of the password.

Example, for a password `asd123`:

```
asd123:74807befd6bdc1c937dc931a3dfadf015da1df1b99b74cd8d91210788e0141a5$1$f21cb2dd667209d6  
39f6be48cf83826a657730032bdacb04465262d221bfc509
```

6. Replace the plain text password in `tomcat-users.xml` with the generated password hash and save the `tomcat-users.xml` file. **NOTE:** When you have defined a `MessageDigestCredentialHandler` in the `UserDatabaseRealm`, then ALL passwords stored in `tomcat-users.xml` are treated as hash values. You will no longer be able to log in using passwords that are saved as clear text.
7. Start Tomcat.

LDAP

Panopticon Real Time can be configured to authenticate towards a Lightweight Directory Access Protocol (LDAP) or source. By configuring the Apache Tomcat Realm, the server can authenticate users and extract their roles by querying the LDAP source.

The realm's connection to the directory is defined by the `connectionURL` attribute. Each user that can be authenticated must be represented in the directory with an individual entry that corresponds to an element in the initial `DirContext` from the `connectionURL`. This user entry must have an attribute containing the username that is presented for authentication.

You can add a dedicated user with `connectionName` and `connectionPassword` in a Realm to define a user with a **Read** access to the user database and roles. If for example the admin `cn` name is set as **admin** and the admin `password` is set as **admin**, then you need to add these properties as shown in the example below.

The `userPattern` attribute may be used to specify the DN, with “{0}” marking where the username should be substituted.

The role is usually an LDAP group entry with one attribute containing the name of the role and another one whose values are distinguished names or usernames of the users in that role. The following attributes configure a directory search to find the names of roles associated with the authenticated user:

- roleBase:** The base entry for the role search. If not specified, the search base is the top-level directory context
- roleSearch:** The LDAP search filter for selecting role entries
- roleName:** The attribute in a role entry containing the name of that role
- roleNested:** Includes nested roles if set to **true**. This means every newly found `roleName` and distinguished Name will be recursively tried for a new role search. The default behavior is **false**.

The following is an example on how the Realm can be configured when using LDAP, in `conf/server.xml`. Please note that the values should be replaced with details from your own LDAP source.

```
<Realm className="org.apache.catalina.realm.JNDIRealm"
  connectionURL="ldap://localhost:389"
  connectionName="cn=admin,dc=test,dc=com"
  connectionPassword="admin"
  userPattern="uid={0},ou=users,dc=test,dc=com"
  roleBase="ou=groups,dc=test,dc=com"
  roleName="cn"
  roleSearch="(uniqueMember={0})"
  rolenested="true"
/>
```

Using this configuration, the realm determines the user's distinguished name by substituting the username into the `userPattern`, authenticates by binding to the directory with this DN and the password received from the user, and searches the directory to find the user's roles.

NOTE

If you opt not to have a dedicated user, remove `connectionName` and `connectionPassword`, and then have each user extract information about itself. You do this by adding `userSearchAsUser` and `roleSearchAsUser` in a Realm and setting both values to **true**. The recommended usage, however, is to have a dedicated user. This allows you to always have the rights to query a LDAP, unlike using `userSearchAsUser` and `roleSearchAsUser` where there is no guarantee that each user is authorized to extract these details.

You can specify more than one LDAP domain by defining a **Combined Realm**. This is done by putting more than one Realm configuration within a parent `CombinedRealm`:

```
<Realm className="org.apache.catalina.realm.CombinedRealm" >
  <Realm className="org.apache.catalina.realm.JNDIRealm"
    (realm details...) />
  <Realm className="org.apache.catalina.realm.JNDIRealm"
```

```
(realm details...) />
</Realm>
```

NOTE

LockOutRealm (mentioned at the start of this chapter) is an implementation of the Tomcat Realm interface that extends the CombinedRealm. For further information, please see Apache Tomcat 9 documentation on <https://tomcat.apache.org/tomcat-9.0-doc/realm-howto.html>.

Using LDAPS

To use TLS/SSL encrypted communication between Panopticon Real Time and the LDAP directory, we need to make the following changes in configuration:

- Change the protocol in the LDAP URL to **ldaps**
- Change the port in the LDAP URL to an SSL enabled port, typically **636**
- If the LDAP directory is configured with a self-signed certificate; the certificate needs to be imported into a TrustStore.

See an example of a Tomcat Realm using LDAPS below:

```
<Realm className="org.apache.catalina.realm.JNDIRealm"
  connectionURL="ldaps://ldap-server:636"
  connectionName="cn=admin,dc=test,dc=com"
  connectionPassword="admin"
  userPattern="uid={0},ou=users,dc=test,dc=com"
  roleBase="ou=groups,dc=test,dc=com"
  roleName="cn"
  roleSearch="(uniqueMember={0})"
  rolenested="true"
/>
```

There are two options for trusting a self-signed LDAP certificate:

- Import the certificate into the JVM TrustStore

The JVM TrustStore is located at `JAVA_HOME/lib/security/cacerts`. Use the command below to add a new trusted certificate to the TrustStore:

```
keytool -import -alias ldap -keystore cacerts -trustcacerts -file ldap.crt
-noprompt -storepass changeit
```

- Create an application TrustStore

1. Import the chain certificate:

```
keytool -import -alias root -keystore ldaptruststore.jks -trustcacerts
-file ca.pem -noprompt -storepass changeit
```

2. Import the LDAP server certificate:

```
keytool -import -alias ldap -keystore ldaptruststore.jks -file ldap.crt
-noprompt -storepass changeit
```

3. Check the TrustStore.

```
keytool -list -keystore ldaptruststore.jks -storepass changeit
```

4. Configure Tomcat to use the new TrustStore by editing `setenv.bat/.sh`:

◆ `setenv.bat` (Windows)

```
set JAVA_OPTS=%JAVA_OPTS% "-Djavax.net.ssl.trustStore=[path to  
ldaptruststore.jks]" "-Djavax.net.ssl.trustStorePassword=changeit"
```

◆ `setenv.sh` (Linux)

```
export JAVA_OPTS="$JAVA_OPTS -Djavax.net.ssl.trustStore=[path to  
ldaptruststore.jks]-Djavax.net.ssl.trustStorePassword=changeit"
```

With either approach, Tomcat need to be restarted for the changes to have effect.

Active Directory

Panopticon Real Time can be configured to authenticate towards an Active Directory server. Panopticon Real Time is using LDAP to interact and communicate with the Active Directory server. Therefore, the configuration is very similar to the LDAP configuration in the previous section.

The following is an example on how the Realm can be configured when using Active Directory. Please note that the values should be replaced with details from your own LDAP source.

```
<Realm className="org.apache.catalina.realm.JNDIRealm"  
  adCompat="true"  
  connectionURL="ldap://ad.test.com:3268"  
  alternateURL="ldap://ad.test.com:389"  
  authentication="simple"  
  referrals="follow"  
  connectionName=admin@test.com  
  connectionPassword="admin"  
  userBase="cn=Users,dc=test,dc=com"  
  userSearch="(sAMAccountName={0}) "  
  userSubtree="true"  
  roleBase="cn=Users,dc=test,dc=com"  
  roleName="cn"  
  roleSearch="(member={0}) "  
  roleSubtree="true"  
  roleNested="true"  
/>
```

NOTE

- Similar with LDAP, you can opt not to have a dedicated user by removing `connectionName` and `connectionPassword` and instead let each user extract information about itself by adding `userSearchAsUser` and `roleSearchAsUser` in a Realm. Set both values to **true**. As mentioned in the LDAP section, the recommended usage is to have a dedicated user since there is no guarantee that each user is authorized to extract these details.
- For the `userSearch` attribute you can use either `"(sAMAccountName={0})"` or `"(UserPrincipalName={0})"`.
 - `sAMAccountName` supports clients and servers pre-Windows 2000 and expects the input format `DomainName\userName`.
 - `UserPrincipalName` is a modern, internet-style user name and expects input on the format `userName@DomainName.com`.

Example:

```
<Realm
className="org.apache.catalina.realm.JNDIRealm"
  adCompat="true"
  connectionURL="ldap://ad.test.com:3268"
  alternateURL="ldap://ad.test.com:389"
  userSearchAsUser="true"
  roleSearchAsUser="true"
  authentication="simple"
  referrals="follow"
  userBase="cn=Users,dc=test,dc=com"
  userSearch="(sAMAccountName={0})"
  userSubtree="true"
  roleBase="cn=Users,dc=test,dc=com"
  roleName="cn"
  roleSearch="(member={0})"
  roleSubtree="true"
  roleNested="true"

/>
```

A useful tool when configuring your Active Directory realm is Active Directory Explorer from Microsoft Sysinternals: <https://docs.microsoft.com/en-us/sysinternals/downloads/adexplorer>.

USEFUL TIP

Depending on how your Active Directory is set up, you may need to specify different attribute values for your `userBase` and your `roleBase`. For further info, see Apache Tomcat 9 documentation about realms: <https://tomcat.apache.org/tomcat-9.0-doc/realms-howto.html>.

Abbreviations used: CN = Common Name, OU = Organizational Unit, DC = Domain Component

WINDOWS AUTHENTICATION

Panopticon Real Time supports Windows authentication. Panopticon Real Time will authenticate a user towards the local machine and verify its credentials with the existing and configured users on the Windows machine. The Windows authentication operates similarly to the Basic authentication function. Both the username and the password are sent to Panopticon Real Time which they are then verified.

To enable Windows authentication, set this property in the `Panopticon.properties` file:

```
authentication.type=WINDOWS
```

NOTE

Single Sign On is currently not supported with the Windows authentication. In addition, Windows authentication only supports authentication towards the local machine. This means that the machine where Panopticon Real Time is deployed on also must manage all of the users.

SAML

Panopticon Real Time supports Security Assertion Markup Language, SAML2. Upon a login request, Panopticon Real Time will redirect the user to an Identity provider (IdP). The IdP will authenticate the user and redirect the user back to Panopticon Real Time. The response message will be controlled and validated. Username and roles will be extracted from the response message and used within Panopticon Real Time.

Panopticon Real Time will redirect the user back to the IdP upon a logout request. The IdP logout service should then invalidate the SAML token.

Property	Description
<code>authentication.saml.assertion.roles</code>	User attribute for roles configured in the IdP.
<code>authentication.saml.assertion.username</code>	User attribute for username configured in the IdP.
<code>authentication.saml.assertionconsumerservice.url</code>	The URL to the Panopticon assertion consumer service. URL: [Protocol]://[Host]:[Port]/[Context]/server/rest/auth/login Example: http://localhost:8080/panopticon/server/rest/auth/login
<code>authentication.saml.certificate.name</code>	The name of the certificate used to validate signature and/or sign outgoing SAML messages
<code>authentication.saml.certificate.password</code>	The password of the certificate used to validate signature and/or sign outgoing SAML messages..
<code>authentication.saml.challenge.required</code>	Determines whether the IdP-first authentication with SAML is enabled or not. To enable, set this property to false .
<code>authentication.saml.identityprovider.logout.url</code>	The URL to the IdP logout service.
<code>authentication.saml.identityprovider.url</code>	The URL to the IdP login service.
<code>authentication.saml.keystore.file</code>	The location of the Keystore file that contains the certificate.
<code>authentication.saml.keystore.password</code>	The password to the Keystore file.

<code>authentication.saml.serviceprovider.id</code>	The ID of the service provider configured in the IdP.
<code>authentication.saml.identityprovider.certificate.file</code>	Takes a file path to a certificate file that contains the IdP's public key.
<code>authentication.saml.identityprovider.signature.validation.required</code>	Specifies whether to require a valid IdP signature to be present on the SAML response. Default value is false .
<code>authentication.saml.provider</code>	The IdP provider. Possible values are OPENSAML , OPENAM . Default value is OPENSAML .
<code>authentication.saml.keystore.type</code>	The key store type. Possible values are JKS , JCEKS , PKCS12 . Default value is JKS .
<code>authentication.saml.login.redirect.url</code>	Redirects the user to the specified URL after successfully logging in. This property can be left blank, in which case the user is redirected to the URL they requested to access.
<code>authentication.saml.logout.redirect.url</code>	Redirects the user back to the specified URL after logging out. This is mainly used with a proxy. In which case, Panopticon Real Time does not know the endpoint which the user is going towards to, and therefore cannot redirect the user back to the Overview page. If you are using OpenAM this is required, otherwise this property can be left blank.
<code>authentication.saml.openam.meta.alias</code>	The meta alias for the IdP if you are using OpenAM.

Using SAML Through OpenAM

To enable roles mapping with OpenAM, perform the following configuration in the IdP:

1. Add value **isMemberOf** to the LDAP User Attributes list in your Data Store.
2. Add value **isMemberOf** to the attributes mapping in your IdP configuration.
3. Set `authentication.saml.assertion.roles=isMemberOf` in the [Panopticon.properties](#).

OAUTH 2.0

This section discusses how to configure Panopticon Real Time to use the OAuth 2.0 for authorization. Upon a login request, Panopticon Real Time will redirect the user to the Login page provided by the OAuth 2.0.

Note that OAuth 2.0 does not normally provide support on how to authenticate the user, Panopticon Real Time will only know if the user is authorized or not. To authenticate the user, Panopticon Real Time can be configured to use a REST service to extract the user identity with an access token retrieved from the OAuth 2.0 provider. In addition to the standard OAuth 2.0 configurations, the server includes properties (i.e., `authentication.oauth2.*`) that are specifically used to extract the user details.

If user roles are configured, the user identity attribute (i.e., `authentication.oauth2.identity.attribute.roles=<Name of role attribute in OAuth2 server>`) will expect a list of roles that enable role based access restrictions on workbook folders.

For example: `"roles": ["VIEWER", "DESIGNER"]`

If this attribute is not set, the default role VIEWER is used.

To use OAuth2.0, change the authentication type:

```
authentication.type=OAUTH2
```

Afterwards, go through the following properties to be configured with respect to your OAuth server configuration.

Property	Description
authentication.oauth2.client.id	The ID of the OAuth 2.0 client.
authentication.oauth2.client.secret	The secret used by the OAuth 2.0 client.
authentication.oauth2.identity.attribute.roles	The attribute that will be extracted from the identity response and used as the role.
authentication.oauth2.identity.attribute.roles.pattern	Takes regex used to extract the roles from the OAuth 2.0 server identity response. For example, the returned string: <code>cn=admin,ou=groups,dc=openam,dc=openidentityplatform,dc=org,cn=designer,ou=groups,dc=openam,dc=openidentityplatform,dc=org</code> contains two roles, admin and designer The regex to extract the roles is <code>cn=([^\,]+)</code> .
authentication.oauth2.identity.attribute.username	The attribute that will be extracted from the identity response and used as the username.
authentication.oauth2.identity.url	The URL to the REST service that provides details about the authenticated user.
authentication.oauth2.login.callback.url	The callback URL. The URL should be the same as one of the specified callback URLs used by the client. The URL should refer to Panopticon Real Time.
authentication.oauth2.login.response.type	The response type. The only response type that is currently supported is code . The value can also be left blank.
authentication.oauth2.login.redirect.url	Redirects the user to the specified URL after successfully logging in. This property can be left blank, in which case the user is redirected to the URL they requested to access.
authentication.oauth2.login.scope	The requested scope. The property can be left blank.
authentication.oauth2.login.url	The URL to the OAuth 2.0 login resource. This field can be left blank.
authentication.oauth2.logout.redirect.url	Logging out revokes the token from the authentication server if the property <code>authentication.oauth2.logout.url</code> is set to the revocation URL. If this property is not set, the server will only remove its own token. If none of these properties are set, the server will attempt to redirect to the start page of the Panopticon when logging out.
authentication.oauth2.logout.url	The URL to the OAuth 2.0 logout resource. This property can be left blank.
authentication.oauth2.token.method	The method on how the token should be retrieved. Supported values are QUERY , BODY , and HEADER .
authentication.oauth2.token.url	The URL to the OAuth 2.0 token resource.

access.default.roles	The default role that will be assigned to everyone to execute a specific service. The field can be left blank. If left blank, VIEWER role is used.
access.administrator.groups	The list of administrator roles authenticated by the OAuth2.0 server.
access.designer.groups	The list of designer roles authenticated by the OAuth2.0 server.
access.viewer.groups	The list of viewer roles authenticated by the OAuth2.0 server.

Example

For an example of OAuth2.0 server configuration, here are some roles and users:

Roles/Groups available:

- admin-backend
- admin-all
- server-designers
- server-viewers
- server-viewer-groupX

Users:

1. **username**:testuser, **roles**:["server-viewers"]
2. **username**:testuser2, **roles**:["server-viewers","server-designers","admin-all"]

For the OAuth2.0 server authentication, you would have to generate **ClientID** and **ClientSecret**.

To be authenticated by the OAuth2.0 server, the following Panopticon properties will be set:

```

authentication.oauth2.client.id=ClientId
authentication.oauth2.client.secret=ClientSecret
authentication.oauth2.identity.attribute.roles=roles
authentication.oauth2.identity.attribute.username=username
authentication.oauth2.identity.url=https://oauth2/me
authentication.oauth2.login.callback.url=http://localhost:8080/panopticon/server/rest/auth/login
authentication.oauth2.login.redirect.url=
authentication.oauth2.login.response.type=code
authentication.oauth2.login.scope=
authentication.oauth2.login.url=https://oauth2/authorize
authentication.oauth2.logout.redirect.url=
authentication.oauth2.logout.url=
authentication.oauth2.token.method=QUERY
authentication.oauth2.token.url=https://oauth2/access_token
authentication.type=OAUTH2
access.default.roles=
access.administrator.groups=admin-backend,admin-all
access.designer.groups=server-designers
access.viewer.groups=server-viewers,server-viewer-groupX

```

Using OAuth 2.0 Through OpenAM

To enable roles mapping and username retrieval with OpenAM, perform the following configuration in the IdP:

1. Add value **isMemberOf** to the LDAP User Attributes list in your Data Store.
2. Add values **uid|Username** and **isMemberOf|Groups** to the scopes mapping in your OAuth agent configuration.

Example configuration in [Panopticon.properties](#):

```
authentication.oauth2.client.id=panopticon
authentication.oauth2.client.secret=password123
authentication.oauth2.identity.attribute.roles=isMemberOf
authentication.oauth2.identity.attribute.roles.pattern=cn= ([^, ]+)
authentication.oauth2.identity.attribute.username=uid
authentication.oauth2.identity.url=http://localhost:9080/openam/oauth2/t
okeninfo
authentication.oauth2.login.callback.url=http://localhost:8080/panoptico
n/server/rest/auth/login
authentication.oauth2.login.redirect.url=
authentication.oauth2.login.response.type=code
authentication.oauth2.login.scope=uid isMemberOf
authentication.oauth2.login.url=http://localhost:9080/openam/oauth2/auth
orize
authentication.oauth2.logout.redirect.url=http://localhost:8080/panoptico
n
authentication.oauth2.logout.url=http://localhost:9080/openam/oauth2/tok
en/revoke
authentication.oauth2.token.method=QUERY
authentication.oauth2.token.url=http://localhost:9080/openam/oauth2/acce
ss_token
authentication.type=OAUTH2
```

FILTER

Custom authentication filters can be applied to the server and the application when the default authentication settings are not sufficient. This type of authentication is referred to as **Filter authentication**. When Panopticon Real Time is configured to use filter authentication, it means that the incoming requests have already been authenticated and authorized before reaching the server. Follow the steps below to configure filter authentication:

1. Open the [Panopticon.properties](#) file in the AppData folder (**c:\vizserverdata**).
2. Enable `authentication.type=FILTER` in `Panopticon.properties`.
3. Apply the following URL pattern to your own filter: `/*`
4. Save the changes and restart the Tomcat.

Creating a Custom Filter

The custom filter will be a basic authentication filter which will authenticate the user with hardcoded values. The Principal forwarded by the filter will be used to authenticate the user.

The filter will require the following dependencies:

- Javax Servlet
- Tomcat embed core

Steps:

1. Create a HTTP request wrapper.

The class will contain the following:

- the original incoming HTTP request
- the Principal which contains both the credentials and the roles for the authenticated user.

The HTTP wrapper will be forwarded to Panopticon Real Time instead of the original incoming HTTP request.

```
import org.apache.catalina.realm.GenericPrincipal;
import org.apache.catalina.users.MemoryUser;
import javax.servlet.http.HttpServletRequest;
import javax.servlet.http.HttpServletRequestWrapper;
import java.security.Principal;

public class FilterRequestWrapper extends HttpServletRequestWrapper {

    private final GenericPrincipal principal;

    public FilterRequestWrapper(final HttpServletRequest request, final
GenericPrincipal principal) {
        super(request);
        this.principal = principal;
    }

    @Override
    public Principal getUserPrincipal() {
        return principal;
    }

    @Override
    public boolean isUserInRole(final String role) {
        if (principal != null) {
            return principal.hasRole(role);
        }
        return super.isUserInRole(role);
    }
}
```

2. Create a custom filter. The filter will create a new Principal which includes both the credentials and the groups/roles for the user.

In this example, the class `GenericPrincipal` contains username, password, and groups. Panopticon Real Time is only able to extract the groups from `GenericPrincipal` class or the `MemoryUser` class. Both the Principal and the original HTTP request will be wrapped in an instance of `FilterRequestWrapper`. The wrapper will then be forwarded towards Panopticon Real Time.

```
import org.apache.catalina.realm.GenericPrincipal;
import org.apache.catalina.users.MemoryUser;
import javax.servlet.*;
import javax.servlet.http.HttpServletRequest;
import javax.servlet.http.HttpServletResponse;
import java.io.IOException;
import java.security.Principal;
import java.util.Arrays;
```

```

import java.util.List;

public class ExampleFilter implements Filter{

    @Override
    public void init(FilterConfig filterConfig) throws ServletException {}

    @Override
    public void doFilter(final ServletRequest servletRequest, final ServletResponse
servletResponse, FilterChain filterChain) throws IOException, ServletException {
        if (!(servletRequest instanceof HttpServletRequest || !(servletRequest
instanceof HttpServletResponse))) {
            return;
        }

        final HttpServletRequest request = (HttpServletRequest) servletRequest;
        final HttpServletResponse response = (HttpServletResponse) servletResponse;
        final String username = "username";
        final String password = "password";
        final List<String> groups = Arrays.asList("Group1", "Group2");
        final GenericPrincipal principal = new GenericPrincipal(username, password,
groups);
        filterChain.doFilter(new FilterRequestWrapper(request, principal),
response);
    }

    @Override
    public void destroy() {}
}

```

3. When these classes have been created, you can compile them and package them in a jar file.
4. Copy the jar file to the WEB-INF/lib folder in the panopticon war file (or the extracted folder).
5. Enable the filter by adding the following code to the web.xml file in panopticon WEB-INF folder:

```

<filter>
    <filter-name>ExampleFilter</filter-name>
    <filter-class>com.datawatch.server.filter.ExampleFilter</filter-class>
</filter>
<filter-mapping>
    <filter-name>ExampleFilter</filter-name>
    <url-pattern>/*</url-pattern>
</filter-mapping>

```

HEADER

It is possible to use a web-facing Panopticon Real Time behind a proxy server that will handle the authentication of users. The proxy server forwards the name of the user and roles to Panopticon Real Time as HTTP headers for every request.

For requests where headers are blank or missing, they are treated like anonymous requests while requests where the user HTTP header are valid are treated like authenticated requests with that specific username.

Requests from the proxy server are fully trusted and checks are no longer performed at Panopticon Real Time about the validity of the username. The authorization on workbooks and administration will work as usual.

To activate the Header authentication, add or update the following properties in the `Panopticon.properties` file:

```
authentication.type=HEADER
authentication.header.role.delimiter=,
authentication.header.roles={roles header}
authentication.header.rolesdynamic={dynamic roles header}
authentication.header.username={userid header}
```

For example:

```
authentication.type=HEADER
authentication.header.role.delimiter=,
authentication.header.roles=X-Roles,X-Company
authentication.header.rolesdynamic=watcher,role_for_{X-Company}
authentication.header.username=X-User
```

[4] ADDITIONAL OR OPTIONAL STEPS

REPLACING PARAMETER VALUES WITH HTTP HEADERS AND COOKIES

Panopticon Real Time can be configured to replace both the incoming and outgoing parameters with HTTP headers and cookies:

- Incoming Parameters** are parameters sent to Panopticon Real Time when requesting data. These types of parameters are also referred to as **request parameters**.
- Outgoing Parameters** are parameters which are returned to the Client when retrieving a workbook. These types of parameters are also referred to as **response parameters**.

This feature is used for employing the user identifier as a parameter and sending the user identifier as a *Header* and *Cookie*. The Server Administrator can configure these properties so that the incoming parameters employ the user identifier value when requesting data. Consequently, the requested HTTP *Header* and *Cookie* values will be tailored for each user. The Server Administrator can also update these properties so that the outgoing parameters get updated when loading a workbook. For example, if you want the user's identifier to be shown in the workbook as a Title.

Replacing the parameter values with Header and Cookie values is achieved by configuring certain properties in the `Panopticon.properties` file located in the `Appdata` folder or `c:\vizserverdata`).

Updating incoming parameters can be achieved by configuring the following properties:

Property	Request parameter mapping
Attribute	<code>request.cookie.parameters.mapping.required</code>
Description	The parameters that are required to be updated with certain cookie values. This property will only affect incoming parameters. The operation will fail if configured cookie values are not present in the request. The property should be formatted as follows: Parameter name (Value delimiter) Cookie name.
Default Value	
Property	Request parameter mapping
Attribute	<code>request.cookie.parameters.mapping.optional</code>
Description	The parameters that could be updated with certain cookie values. This property will only affect incoming parameters. The operation will not fail if the cookie values are not present in the request. The parameters will keep their default value instead of the configured cookie value if the cookie is not present. The property should be formatted as follows: Parameter name (Value delimiter) Cookie name.
Default Value	
Property	Request parameter mapping

Attribute	<code>request.cookie.parameters.mapping.entry.delimiter</code>
Description	The delimiter that separates the configuration entries. This property will only affect incoming parameters.
Default Value	, (Comma)
Property	Request parameter mapping
Attribute	<code>request.cookie.parameters.mapping.value.delimiter</code>
Description	The delimiter that separates the parameter name and the cookie name. This property will only affect incoming parameters.
Default Value	: (Colon)
Property	Request parameter mapping
Attribute	<code>request.header.parameters.mapping.required</code>
Description	The parameters that are required to be updated with certain header values. This property will only affect incoming parameters. The operation will fail if a configured header values are not present in the request. The property should be formatted as follows: Parameter name (Value delimiter) Header name.
Default Value	
Property	Request parameter mapping
Attribute	<code>request.header.parameters.mapping.optional</code>
Description	The parameters that could be updated with certain header values. This property will only affect incoming parameters. The operation will not fail if the header values are not present in the request. The parameters will keep their default value instead of the configured header value if the header is not present. The property should be formatted as follows: Parameter name (Value delimiter) Header name.
Default Value	
Property	Request parameter mapping
Attribute	<code>request.header.parameters.mapping.entry.delimiter</code>
Description	The delimiter that separates the configuration entries. This property will only affect incoming parameters.
Default Value	, (Comma)
Property	Request parameter mapping
Attribute	<code>request.header.parameters.mapping.value.delimiter</code>
Description	The delimiter that separates the parameter name and the header name. This property will only affect incoming parameters.
Default Value	: (Colon)

The following properties can be configured to update outgoing parameters:

Property	Response parameter mapping
Attribute	<code>response.operation.parameters.mapping.required</code>
Description	The parameters that are required to be updated with certain Header values. This property will only affect outgoing parameters. The operation will fail if configured Header values are not present in the request. The property should be formatted as follows: Parameter name (Value delimiter) Header name.
Default Value	
Property	Response parameter mapping
Attribute	<code>response.operation.parameters.mapping.optional</code>
Description	The parameters that could be updated with certain Header values. This property will only affect outgoing parameters. The operation will not fail if the Header values are not present in the request. The parameters will keep their default value instead of the configured Header value if the Header is not present. The property should be formatted as follows: Parameter name (Value delimiter) Header name.
Default Value	
Property	Response parameter mapping
Attribute	<code>response.operation.parameters.mapping.entry.delimiter</code>
Description	The delimiter that separates the configuration entries. This property will only affect outgoing parameters.
Default Value	, (Comma)
Property	Response parameter mapping
Attribute	<code>response.operation.parameters.mapping.value.delimiter</code>
Description	The delimiter that separates the parameter name and the Header name. This property will only affect incoming parameters.
Default Value	: (Colon)

Example

This section describes how incoming parameters are replaced with Header values. For example, Panopticon Real Time is required to update parameters **uid** and **uname**.

Parameter Name	Update With Header
uid	userIDHeader
uname	userNameHeader

The request will fail if the required *Headers* are not present in the incoming request.

For the next example, Panopticon Real Time will try to update the parameter **ulocation** with **userLocationHeader** header. The parameter value will only be updated if the Header is available.

In both configurations, comma was used as an entry delimiter and colon as a delimiter between the parameter name and the Header name.

However, for outgoing parameters, the property prefix (request) must be changed to **response** instead.

Configurations:

```
request.header.parameters.mapping.required=uid:userIdHeader,uname:userNameHeader
request.header.parameters.mapping.optional=olocation:userLocationHeader
request.header.parameters.mapping.entry.delimiter=,
request.header.parameters.mapping.value.delimiter=:
```

NOTE

Mapping the same parameter in both the header and cookie will throw an exception on initialize.

FILE UPLOAD SIZE LIMITS SETTINGS IN TOMCAT AND PANOPTICON

Starting with version 2020.0 and the introduction of web authoring, any connection to a file data source involves uploading the file first to the server then loading its data into Panopticon. The upload happens as part of using the data connector for the file.

Setting the limit of the file upload sizes are done in the following properties:

maxSwallowSize

This setting is part of the overall Tomcat configuration, particularly for the HTTP connector, and is found in the `<tomcat>/conf/server.xml` file.

`maxSwallowSize` controls how much data Tomcat will accept for upload before it is cancelled or terminated. If the file size is larger than the `file.upload.size.max.bytes`, and the limit of `maxSwallowSize` is hit, then Panopticon will never get a chance to send a proper error message about the file being too large. The upload will simply be terminated with a message about an unknown error. It is therefore recommended to set the `maxSwallowSize` value high enough to the file size that Panopticon users are expected to load.

Any minus value (e.g., -1), means unlimited. Setting a minus value for `maxSwallowSize` creates a risk of getting the Tomcat connection saturated by a very large file upload or being stuck in an infinite file upload. A reasonable setting would be something between one to two times of the Panopticon `file.upload.size.max.bytes` property value.

Example:

```
<Connector port="8080" protocol="HTTP/1.1"
  connectionTimeout="20000"
  redirectPort="8443"
  maxSwallowSize="100000000"/>
```

file.upload.size.max.bytes

This property is part of the Panopticon specific settings found in the [Panopticon.properties](#) file in the `PanopticonAppdata` folder (i.e., `c:\vizserverdata`).

This size limit property (in bytes) controls how large are the files Panopticon will accept to connect to for loading data.

If the file exceeds the size limit, there will be an informative error message that indicates the current size limit. The size limit check can only take place on the condition that the file has already been successfully uploaded to the server. The upload success depends on the limit set in `maxSwallowSize`.

TOMCAT MEMORY CONFIGURATION FOR LINUX

NOTE

It is recommended to increase the Java heap size of Tomcat to avoid the initiation of garbage collection when memory usage hits the set threshold.

The steps may vary depending on how Tomcat was deployed.

Steps:

1. Stop Tomcat.
2. Create a file named `setenv.sh`.
3. Place the file in the Tomcat `bin` folder.
4. Set the minimum and maximum heap size with the JVM `-Xms` and `-Xmx` parameters. A minimum of 1 GB is recommended. For example:

```
JAVA_OPTS="$JAVA_OPTS -Dfile.encoding=UTF-8 -server -Xms512m -Xmx2g"
```

NOTE

Setting the maximum value should be dependent on your system. Ensure that the heap size is not larger than the available free RAM on your system. It is recommended to use 80% of the available RAM not taken by the operating system or other processes of your JVM.

5. Save the file.
6. Restart Tomcat to apply the increase in the heap.

TOMCAT MEMORY CONFIGURATION FOR WINDOWS

NOTE

It is recommended to increase the Java heap size of Tomcat to avoid the initiation of garbage collection when memory usage hits the set threshold.

Steps:

1. Stop Tomcat.
2. Create a file named `setenv.bat`.
3. Place the file in the Tomcat `bin` folder.
4. Set the minimum and maximum heap size with the JVM `-Xms` and `-Xmx` parameters. A minimum of 1 GB is recommended. For example:

```
set JAVA_OPTS=%JAVA_OPTS% -Dfile.encoding=UTF-8 -server -Xms512m -Xmx2g
```

NOTE

Setting the maximum value should be dependent on your system. Ensure that the heap size is not larger than the available free RAM on your system. It is recommended to use 80% of the available RAM not taken by the operating system or other processes of your JVM.

5. Save the file.
6. Restart Tomcat to apply the increase in the heap.

SET CLIENT AUTOMATIC RECONNECTION TO THE SERVER WHEN DISCONNECTED

When the client loses connection to the server, by default, it will no longer attempt to automatically reconnect to the server.

A notification message displays such as below. Clicking the **Reconnect** link will attempt to reconnect to the server.

The screenshot shows a web application interface with a navigation bar at the top containing various chart types: Intro, Bar, Bar 2, Box Plot, Bullet, Candlestick, Categorical Line Graph, and Circle Pack. A red notification banner at the top reads "Connection to server lost: Reconnect". Below the notification, there is a paragraph of text explaining "Circle Packs" and their benefits. The main content area is divided into three sections, each with a chart view and a "Reconnect" button:

- Flat Circle Pack**: Includes a dropdown menu with "Industry" selected and a "Reconnect" button.
- Cross Tabbed Circle Pack**: Includes a dropdown menu with "Region" selected and a "Reconnect" button.
- Circle Pack Emphasising Hierarchy**: Includes a dropdown menu with "Industry" selected and a "Reconnect" button.

The AppData folder of Panopticon Real Time has a subfolder named JavaScriptConfiguration which contains the file named workbook.json.

Below is an example default content of a \JavaScriptConfiguration\workbook.json file:

```
{
  "baseUrl" : "..",
  "forceClientSelectionHandling" : true,
  "startUrl" : "../",
  "subscriptionCompression" : true,
  "dataLoading" : {
    "transport" : "websocket"
  },
  "webGleEnabled" : true,
  "pdfMultiplePagesEnabled" : true
}
```

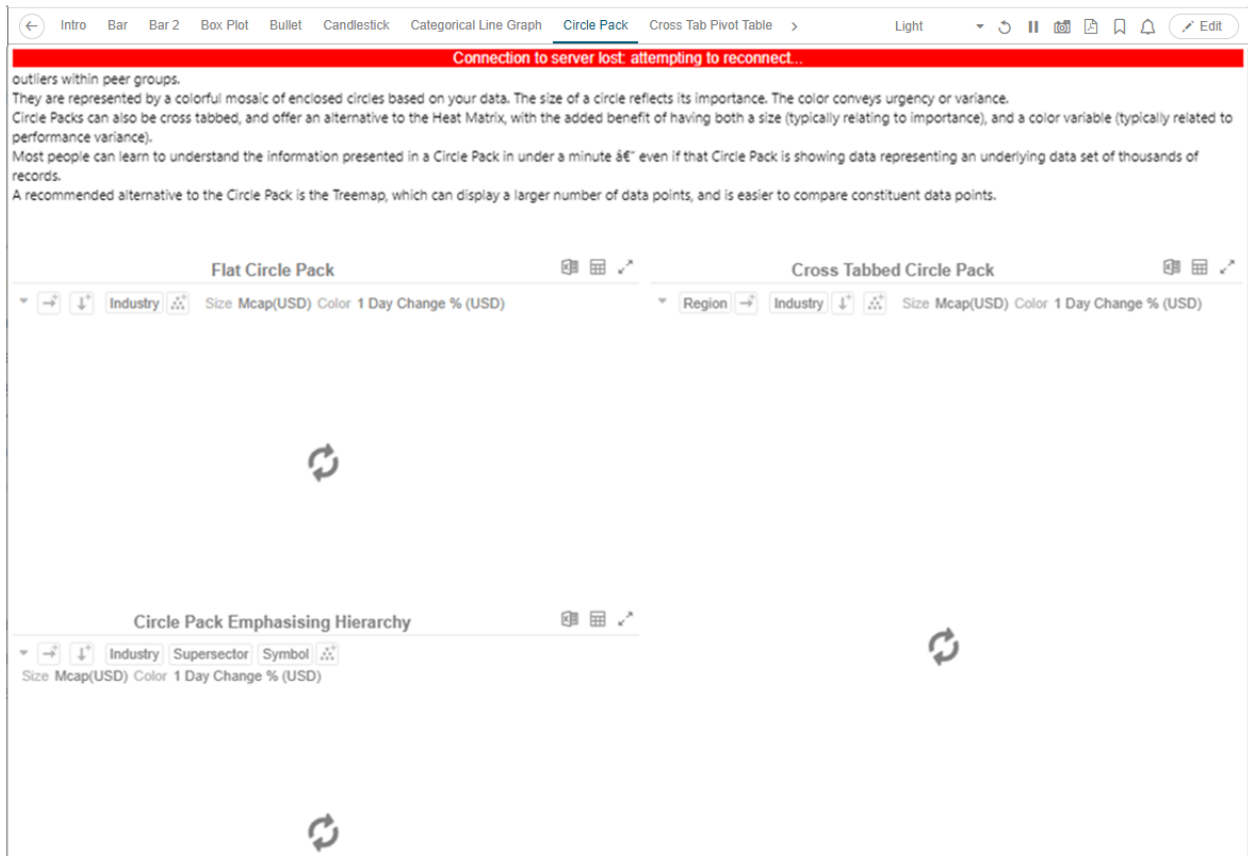

To set automatic reconnection to the server, add the following parameter in the JavaScriptConfiguration\workbook.json file:

```
"automaticReconnectOnServerDisconnect" : true,
```

NOTE

After each change in the workbook.json file, the Panopticon application must be restarted.

A notification message displays such as below. **Connection to server lost: attempting to reconnect...**

AUTOMATIC LOGOUT OF USERS ON TIMEOUT TO SAVE UNUSED LICENSES

Users who have no activity and leave their browsers open may be logged out and their license units are checked out by setting the following properties in the [Panopticon.properties](#) file:

Property	Timeout Session
Attribute	<code>timeout.session.enabled</code>
Description	Boolean value stating if timeout functionality should be used or not.
Default Value	false
Property	Timeout Session
Attribute	<code>timeout.session.exception.delimiter</code>
Description	The delimiter to use for the usernames stated in the <code>timeout.session.exception.usernames</code> property.
Default Value	, (comma)

Property	Timeout Session
Attribute	<code>timeout.session.exception.usernames</code>
Description	Usernames that should be excluded from the timeout functionality. Separated by the delimiter stated in the <code>timeout.session.exception.delimiter</code> property.
Default Value	
Property	Timeout Session
Attribute	<code>timeout.session.minutes</code>
Description	Minutes of inactivity before a user session is terminated by logging out the user.
Default Value	480
Property	Timeout Session
Attribute	<code>timeout.session.notification.minutes</code>
Description	Minutes before a timeout that a notification about session timeout is sent to the user.
Default Value	1

NOTE

- The timeout functionality is only enabled if property `timeout.session.enabled` is set to **true**.
- Each time a user actively interacts with the server, the timeout timer for that user is reset. Just sitting idle on a tab in the UI or having a dashboard open will not reset the timer.
- If `timeout.session.notification.minutes` has been set to a value > 0 , a notification will be sent to the user on an established notification subscription on the websocket, X minutes before the timeout happens. This is the format of the timeout notification:

```

{"TimeoutNotification":{"minutesUntilTimeout":1}}

```
- When a session times out, a logout notification will be sent on an established notification subscription on the WebSocket. This is the format of the logout notification:

```

{"LogoutNotification":{"reason":"Logged out due to session timeout"}}

```
- To abort a session timeout, all that is required is that the user interacts with the server. To facilitate the process there is a new service that can be called using GET on URL `/rest/user/timeout/reset` that will reset the timeout for the calling user. The service itself does not do anything, but the layers the message interacts with before reaching the service will count it as a user activity and resets the timeout.

SETTING THE TRANSPORTATION PROTOCOL

In previous versions, you can control which transportation protocol the browser would use for subscriptions to the server by setting the value (**WEBSOCKET** or **LONG_POLLING**) in the `client.data.load.transport` property in the [Panopticon.properties](#) file.

Starting with version 2020.2, you can instead edit the `workbook.json` and `admin.json` in `<appdata>/JavaScriptConfiguration/`, where you add the section:

```
"dataLoading" : {  
  "transport" : "websocket" or "long-polling"  
}
```

NOTE After each change in the `workbook.json` and `admin.json` files, the Panopticon application must be restarted.

PANOPTICON REAL TIME CONFIGURATIONS FOR EMAIL SEND OUTS AND ALERTS

NOTE When triggering [email send out via the REST API](#), [scheduling](#) email send outs, or sending [email alerts](#), Panopticon Real Time needs to be configured with valid email server information.

The following values need to be configured in the `Panopticon.properties` file located in the `AppData` folder (e.g., `c:\vizserverdata`):

Attribute	Description
<code>email.address</code>	Email address where the alert will be sent from.
<code>email.host</code>	Host name used by the email server.
<code>email.password</code>	Email password, if available.
<code>email.port</code>	Port number used by the email server.
<code>email.security.mode</code>	Security mode used when sending emails. Possible values: NONE , SSL , TLS . The value NONE will be used if there was no value configured for the property.
<code>email.username</code>	Email account username.

FONT INSTALLATION REQUIREMENT FOR PDFS AND IMAGE EXPORT WITH CJK CHARACTERS

When creating PDF reports or exporting images from workbooks that contain text in Chinese, Japanese or Korean (CJK), a font with CJK support is required. The font must be installed on the server operating system. Refer to your operating system documentation on how to install a new font.

The PDF and image export functionalities in Panopticon will use the font specified in the workbook [Theme](#). While used in the browser, the workbooks and dashboards will get the suitable font by the browser if a font with CJK support is needed.

When creating a PDF or an image, the browser is not involved since it happens on the server-side, and correct characters depend on the availability of a font with CJK support on the local system of the server, plus the specification of that font (e.g., **Yu Gothic**), in the workbook Theme. For the list of CJK-supporting fonts, you may refer to https://en.wikipedia.org/wiki/List_of_CJK_fonts.

SETTING SERVER PROPERTIES THROUGH THE ENVIRONMENT VARIABLES

Server properties set in the [Panopticon.properties](#) file in the AppData folder (i.e., `c:\vizserverdata`) are overridden by environment variables.

For example, you can supply a JSON object through the environment variable `SPRING_APPLICATION_JSON` that will be parsed during server start up:

```
{
  "server.id": "Test_Server",
  "subscription": {
    "data.loading.pool.max.size": "5",
    "broadcasting.pool.max.size": "6"
  }
}
```

NOTE Ensure that you minify the JSON object before setting the environment variable.

This will override and set the following property values:

```
server.id=Test_Server
subscription.data.loading.pool.max.size=5
subscription.broadcasting.pool.max.size=6
```

As seen from the example above, you can use inline JSON annotations for properties that share the same prefix, which in this case is **subscription**.

To override a single property, create an environment variable with the same name, but replace each '.' with an '_' and use upper case.

Example: Override the property `server.id`

Name: `SERVER_ID`

Value: `<some value>`

You can also override individual properties with environment variables. Just set a variable with the same name as the property but with all letters in upper case and periods replaced with underscores. For example, **REPOSITORY_STARTUP_IMPORT_PATHS** will override the `repository.startup.import.paths` in [Panopticon.properties](#).

[5] ADVANCED SERVER DEPLOYMENTS

USAGE IN SSL ENABLED ENVIRONMENTS

Enabling SSL for Panopticon Real Time

The steps shown in this guide use the `keytool` command for managing keyStores and certificates. The `keytool` command is part of the Java distribution and can be found in the `JAVA_HOME\bin`. Make sure you have the `JAVA_HOME\bin` folder in your `PATH` environment variable, in order to run the command. Details on the `keytool` command can be found here: <https://docs.oracle.com/javase/8/docs/technotes/tools/unix/keytool.html>

Follow the steps below to configure SSL for Panopticon Real Time.

Steps:

1. Change directory to the `CATALINA_HOME\conf` folder, which is where we want to generate the Tomcat keystore.
2. Create a keyStore file to store the private key and self-signed certificate used to identify the server:

```
keytool -genkey -alias myalias -keyalg RSA -keystore keystore.jks
```

NOTE

Java is strict when validating the certificate of a host.

If the domain name store in the certificate does not match the domain of the server, the connection will be rejected. Enter the target domain name (`www.mydomain.com`) when `keytool` asks for "your first and last name", when running the command above.

3. Add an **SSL HTTP/1.1 Connector** entry in `$CATALINA_BASE/conf/server.xml`

```
<!-- Define a SSL Coyote HTTP/1.1 Connector on port 8443 -->
<Connector

    protocol="org.apache.coyote.http11.Http11NioProtocol"
        port="8443" maxThreads="200"
        scheme="https" secure="true" SSLEnabled="true"
        keystoreFile="conf/keystore.jks"
        keystorePass="keystorepassword"
        clientAuth="false" sslProtocol="TLS"/>
```

4. Disable unencrypted server access by commenting out the default HTTP connector for port 8080.

```
<!--
  <Connector port="8080" protocol="HTTP/1.1"
            connectionTimeout="20000"
            redirectPort="8443" />
-->
```

5. After completing the configuration changes, you must restart Tomcat. When the process is back up you should be able to connect over SSL using the URL below:

```
https://localhost:8443/panopticon
```

Details on how to configure Apache Tomcat SSL can be found at:

```
https://tomcat.apache.org/tomcat-9.0-doc/ssl-howto.html
```

Defining a TrustStore

In scenarios that require TLS-enabled intra-service communication, we need to configure a trustStore. These scenarios include, for instance, LDAP, SAML or OAuth integration.

A trustStore is essentially a keyStore, but where the keyStore is used to store private keys used to identify the server, the trustStore is used to store public keys of trusted *Certificate Authorities* (CA). The trustStore is used to verify certificates presented to the server when establishing an SSL connection.

Follow the steps below to create a new trustStore, import a certificate and configure Java to use the new trustStore:

Steps:

1. Create a new keyStore called **truststore**:

```
keytool -genkey -alias truststore -keyalg RSA -keystore
truststore.jks
```

2. Export a certificate from a keyStore:

```
keytool -export -keystore keystore.jks -alias myalias -file cert.cer
```

3. Import the certificate into the trustStore:

```
keytool -import -trustcacerts -alias myalias -file cert.cer -keystore
truststore.jks
```

You can also re-use a keyStore as a trustStore in which case the certificate does not need to be exported and imported.

To configure a trustStore for Apache Tomcat you need to edit the JAVA_OPTS environment variable in the `setenv` script, located in the Tomcat `conf` folder.

- ❑ On Windows, `setenv.bat`:

```
set JAVA_OPTS=-Djavax.net.ssl.trustStore="C:/location/to/truststore
/truststore.jks"
```

- ❑ On Linux, `setenv.sh`:

```
export JAVA_OPTS="$JAVA_OPTS -
Djavax.net.ssl.trustStore='/location/to/truststore/truststore.jks'";
```

[6] AUTHORIZATION

NOTE Starting with version 2020.0, mapping of administrators through `Administrators.txt` and `AdministratorGroups.txt` is no longer supported. The property `access.administrator.groups` should be used instead.

If the customer's authentication method relied to the use of the `Administrators.txt` or `AdministratorGroups.txt` file, they can still do so by additionally using the [tomcat-users.xml](#) to replicate the usage of these administrator text files.

For example, in the `tomcat-users.xml`, they can assign groups from the administrator text files to specific users like this:

```
<user username="admin" password="admin" roles="role1,otherRole"/>
<user username="admin2" password="admin2" roles="role2"/>
```

Then in the [Panopticon.properties](#) file, use the `access.administrator.groups` property to map the admins (i.e., `admin` and `admin2`) to the administrator groups by adding their `roles:access.administrator.groups=role1,role2`

SECURE ACCESS

Panopticon workbooks published to the folders or subfolders in Panopticon Real Time can be secured by granting [allowed](#) or [denied](#) permissions.

NOTE Beginning with version 16.1.0, new workbooks must be published to a folder or subfolder to use their access restrictions.

However, workbook access restriction is still available and supported on older workbooks that will be accessed in the current and later Panopticon Real Time versions.

Creating Folders

A user with an Administrator or Designer role can create folders.

NOTE Users that log on with a Designer role will have their own personal folder created and displayed on the Workbooks page (e.g., `~designer`).

The personal folders:

- are displayed and can be accessed for users with an Administrator or Designer role.
- are where Designers can create workbooks and build dashboards. For more information, refer to [Altair Panopticon Web Authoring Guide](#) on how to create workbooks on the Web client.

Steps:

1. On the **Workbooks** tab, right-click on the topmost folder, and select **New Folder**.

NOTE

Only Administrators are allowed to change the permissions on the root folder.

The *Create Folder* dialog displays.

NOTE

- Everyone is available in the *Allowed* section by default.
- Removing the Everyone group will mean that the folder and its subfolders will not be available for public access.
- The default group permissions on the root folder are **WRITE + READ**.

2. Enter a *Folder Name*.
3. Proceed to defining the Authorization to [Allowed](#) or [Denied](#) groups and users.

4. Click  .

The new folder is displayed on the expanded Folder hierarchy list and on the Root Folder list.

NOTE

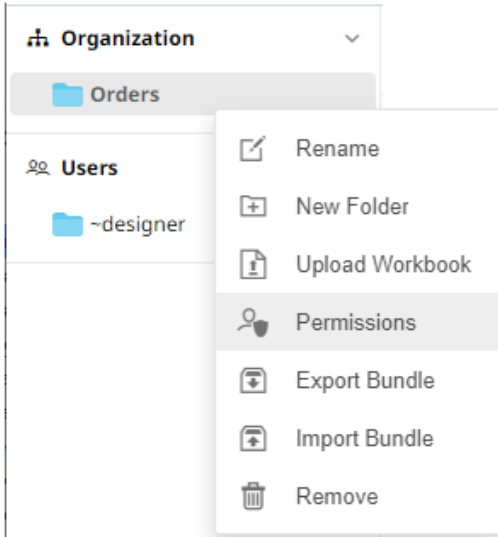

- Folders and subfolders can be deleted if they do not contain published workbooks.
- The folders and subfolders on the *Workbooks* page will also be available on the *Data Library*, *Webhooks*, and *Themes* pages.

Adding Groups and Users with Allowed Authorization

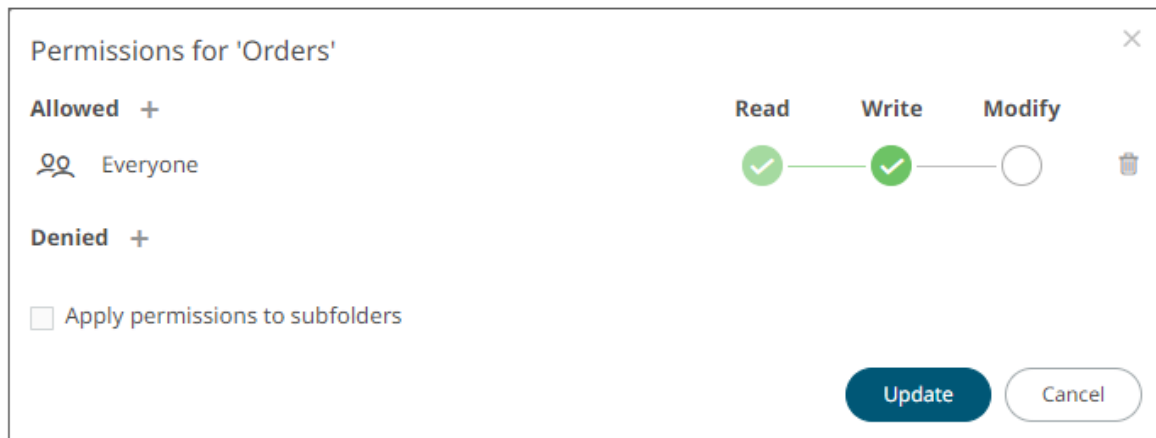

A user with an Administrator or Designer role can grant permissions for users or groups to a workbook folder or subfolder.

Steps:

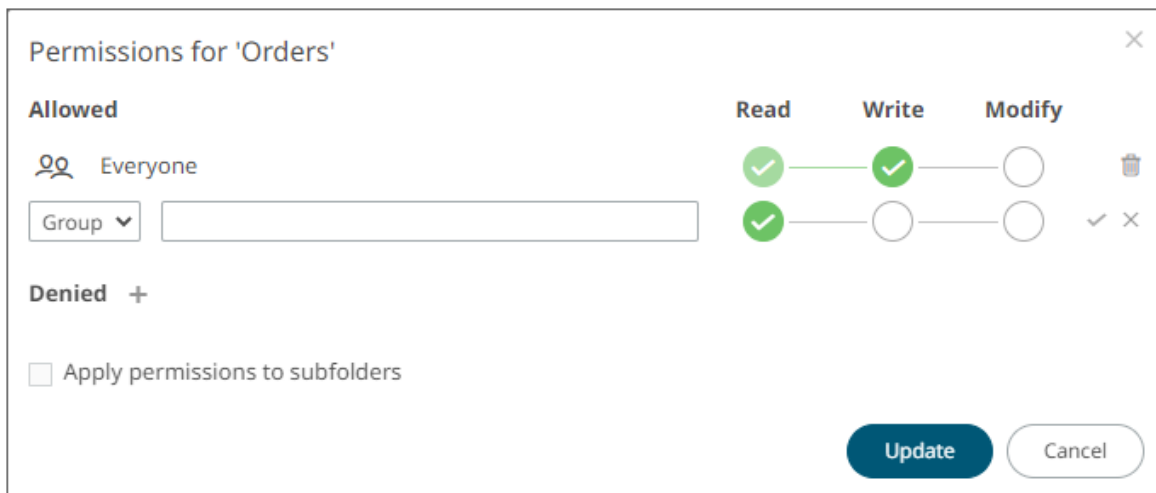

1. Right-click on a folder (except the root folder) and select **Permissions** on the context menu.

The *Permissions* dialog displays.

- Under the *Allowed* section, click the **Add +** icon.
A new *User/Group Allowed* section is displayed.

3. Select **User** or **Group** to be given permission in the drop-down list.

4. Enter the user or group *Name*.
5. Select the permission level that will be granted to the user or group:
 - **READ**
Permission to read the folder.
 - **READ + WRITE**
Permission to write to the folder and read.
 - **MODIFY + WRITE + READ**
Permission to read, modify, and write to the folder as well as create subfolders.

6. Click . The user or group is added under the *Allowed* list.

7. You can either:
 - check the **Apply Permissions to Subfolders** box

This means the permissions that will be used on all of the subfolders will be fetched from the root folder.

NOTE The **Apply Permissions to Subfolders**:

- is only enabled when there is an [existing subfolder](#).
- does not affect the private folders.

- leave the **Apply Permissions to Subfolders** box unchecked and modify the permission properties of the subfolders

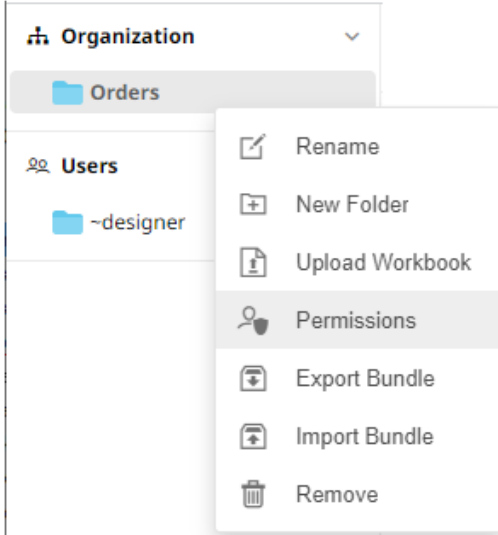

8. Click  to save the changes.

NOTE You can copy the usernames in the *Permissions* dialog by highlighting the text then right-clicking and selecting **Copy** in the context menu.

Adding Groups and Users with Denied Access

Steps:

1. Right-click on a folder and select **Permissions** on the context menu.

The *Permissions* dialog displays.

2. Under the *Denied* section, click the **Add** ⁺ icon.
A new *User/Group Denied* section is displayed.

3. Select **User** or **Group** that will be given denied permission in the drop-down list.
4. Enter the user or group *Name*.
5. Select the denied permission level that will be granted to the user or group:

- **MODIFY**
Prevent user or group to modify and create subfolders.
- **WRITE + MODIFY**
Prevent user or group to modify and write to the folder.
- **READ + WRITE + MODIFY**
Prevent user or group to modify and create subfolders, modify and write to the folder, as well as read the folder.

6. Click ✓. The user or group is added under the *Denied* list.

Repeat until all of the users with denied access are added.

7. Click **Update** to save the changes.

Creating Subfolders

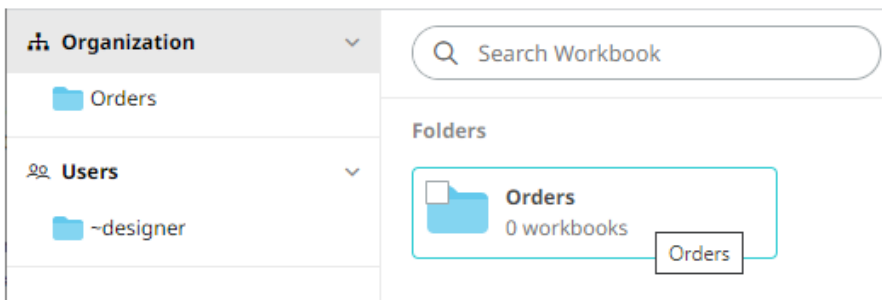

Steps:

1. To create subfolders, you can either click a folder:

- on the expanded *Folder* hierarchy list

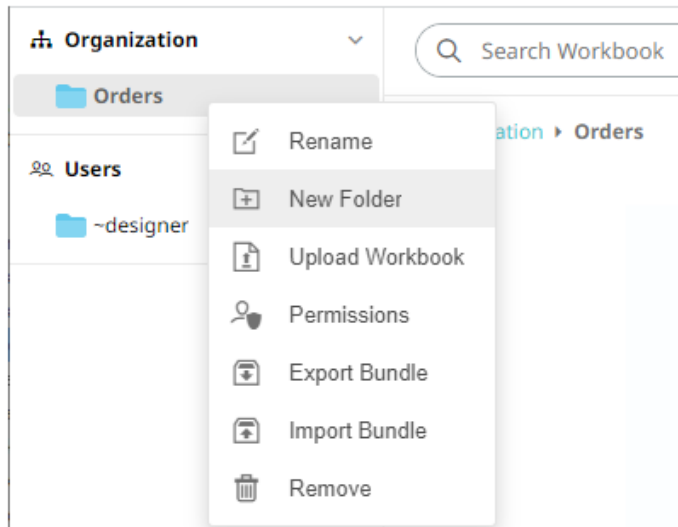

- on the Root workbooks/folders list

The *Folders* page is displayed.

2. Right-click on the folder and select **New Folder**.

Refer to [Creating Folders](#) for the steps in creating the subfolders. Also, [Adding Groups and Users with Allowed Authorization](#) and [Adding Groups and Users with Denied Access](#) for more information on adding Users and Groups with allowed or denied authorization.

The subfolder is added.

3. You can also opt to delete a subfolder by right-clicking on the folder and selecting **Remove** on the context menu as long as it does not contain published workbooks.

A confirmation message displays.

Click  .

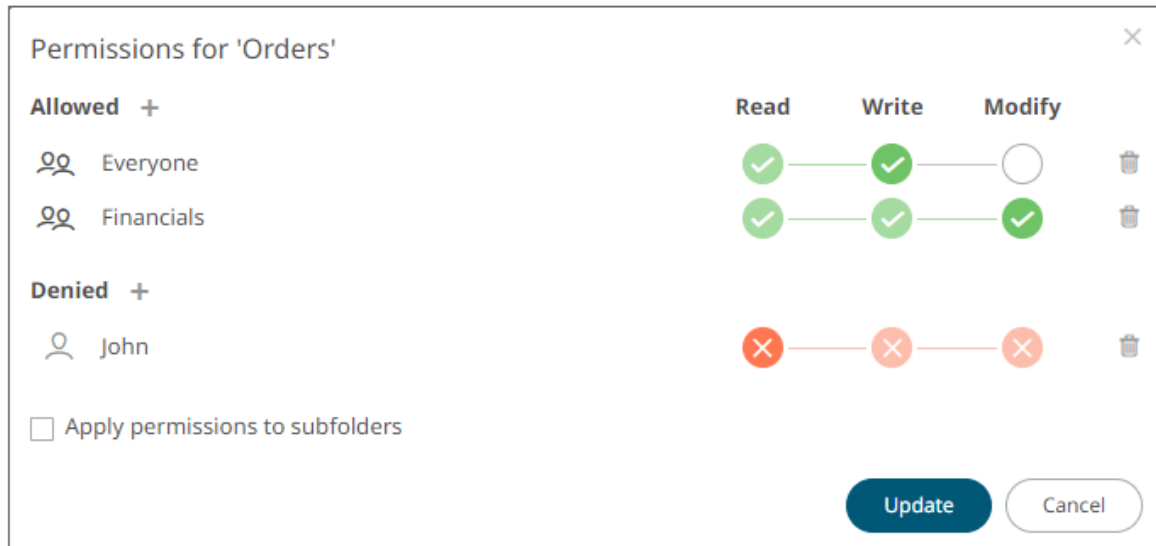

Updating Folder or Subfolder Properties

Steps:

1. To update folder properties, click a folder or a subfolder.
2. Right-click on the folder or subfolder and select **Permissions**.

The corresponding *Permissions* dialog displays.

3. Make the necessary changes such as new folder name, add or delete users and groups.
4. You can either:
 - Check the **Apply Permissions to Subfolders** box
This means the permissions that will be used on all of the subfolders will be fetched from the root folder.

- Leave the **Apply Permissions to Subfolders** box unchecked and modify the permission properties of the subfolders

NOTE

The **Apply Permissions to Subfolders** check box is not enabled when defining the permissions for a subfolder.

Update

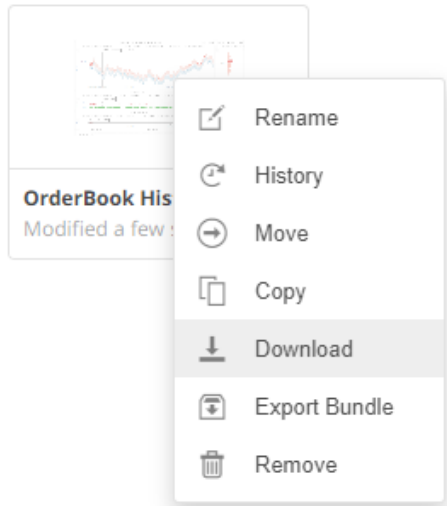

5. Click **Update** to save the changes.

Downloading a Workbook

A user with an Administrator or Designer role with READ + WRITE [permission](#) to the folder is allowed to download a copy of a workbook available in it.

Right-click on a workbook and select **Download** on the context menu.

Workbooks

A copy of the workbook is downloaded.

Exporting Workbook or Folder Bundle

NOTE

- Data files associated with workbooks will only be included in the download if they are available inside the repository.
- Users will only be able to download workbooks from folders where they have WRITE permission.

Steps:

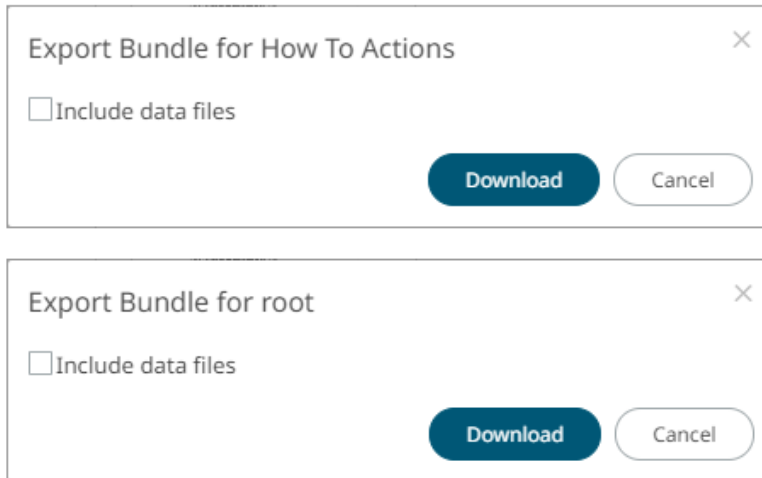

1. Right-click on a workbook or folder and select **Export Bundle** on the context menu.

Workbook Folder or Subfolder Context Menu

Workbook Context Menu

A notification message displays.

2. Check the **Include Data Files** box to include the associated workbook data files in the download.
3. Click . A copy of the workbook or folder bundle is downloaded.

Importing Workbooks Bundle

NOTE

- Users will only be able to import a bundle to folders where they have WRITE permission.
- Existing workbooks with the same name as the uploaded workbooks will be archived, only if the new workbook differs from the current one. Consequently, the uploaded version will be the current one.
- The bundle must not exceed the value set in the property `file.upload.size.max.bytes` in the `Panopticon.properties`.

Steps:

1. Right-click on a folder and select **Import Bundle** on the context menu.

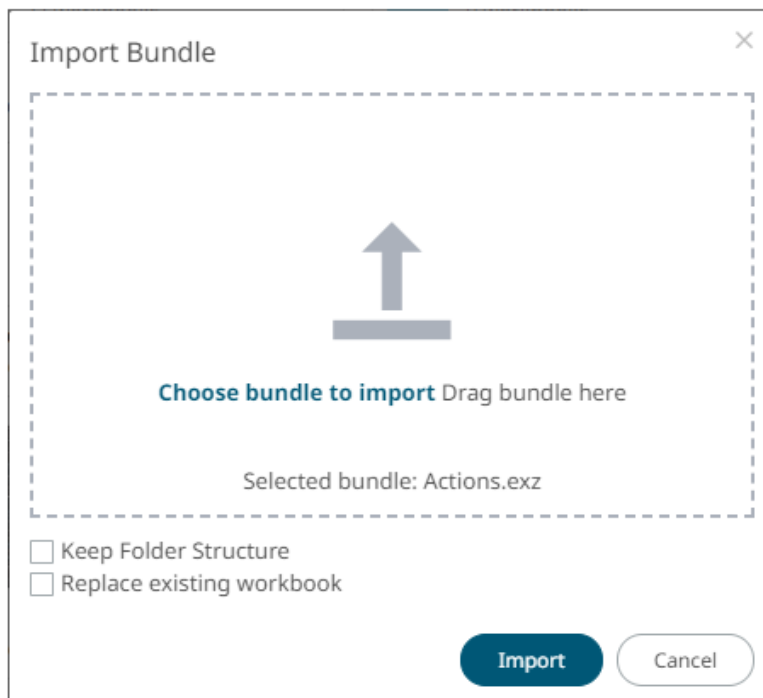

The *Import Bundle* dialog displays.

2. To import a bundle, you can either:
 - drag it from your desktop and drop on the dialog, or
 - click **Choose Bundle to Import** and select one on the *Open* dialog that displays.

The name of the selected bundle is displayed on the dialog box.

3. Check the **Keep Folder Structure** box.

This means the exported folder structure is maintained when uploading the bundle. If the folders do not exist on the server, they will be created.

4. To replace an existing workbook, check the **Replace existing workbook** box.

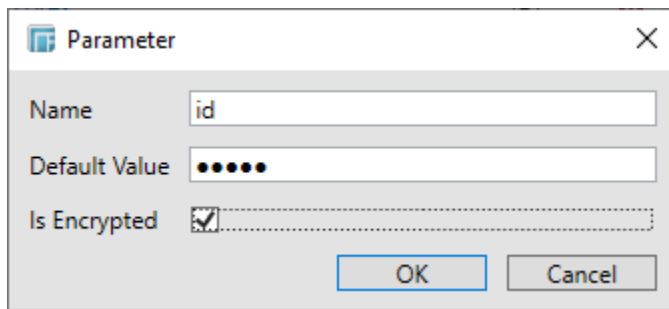

5. Click  .

Data Level Secure Access

In this case the data being displayed is filtered to a particular authenticated user.

Data is filtered using the special parameter **_user_id**.

This **_user_id** parameter is replaced at run time by the authenticated user id in lower case.

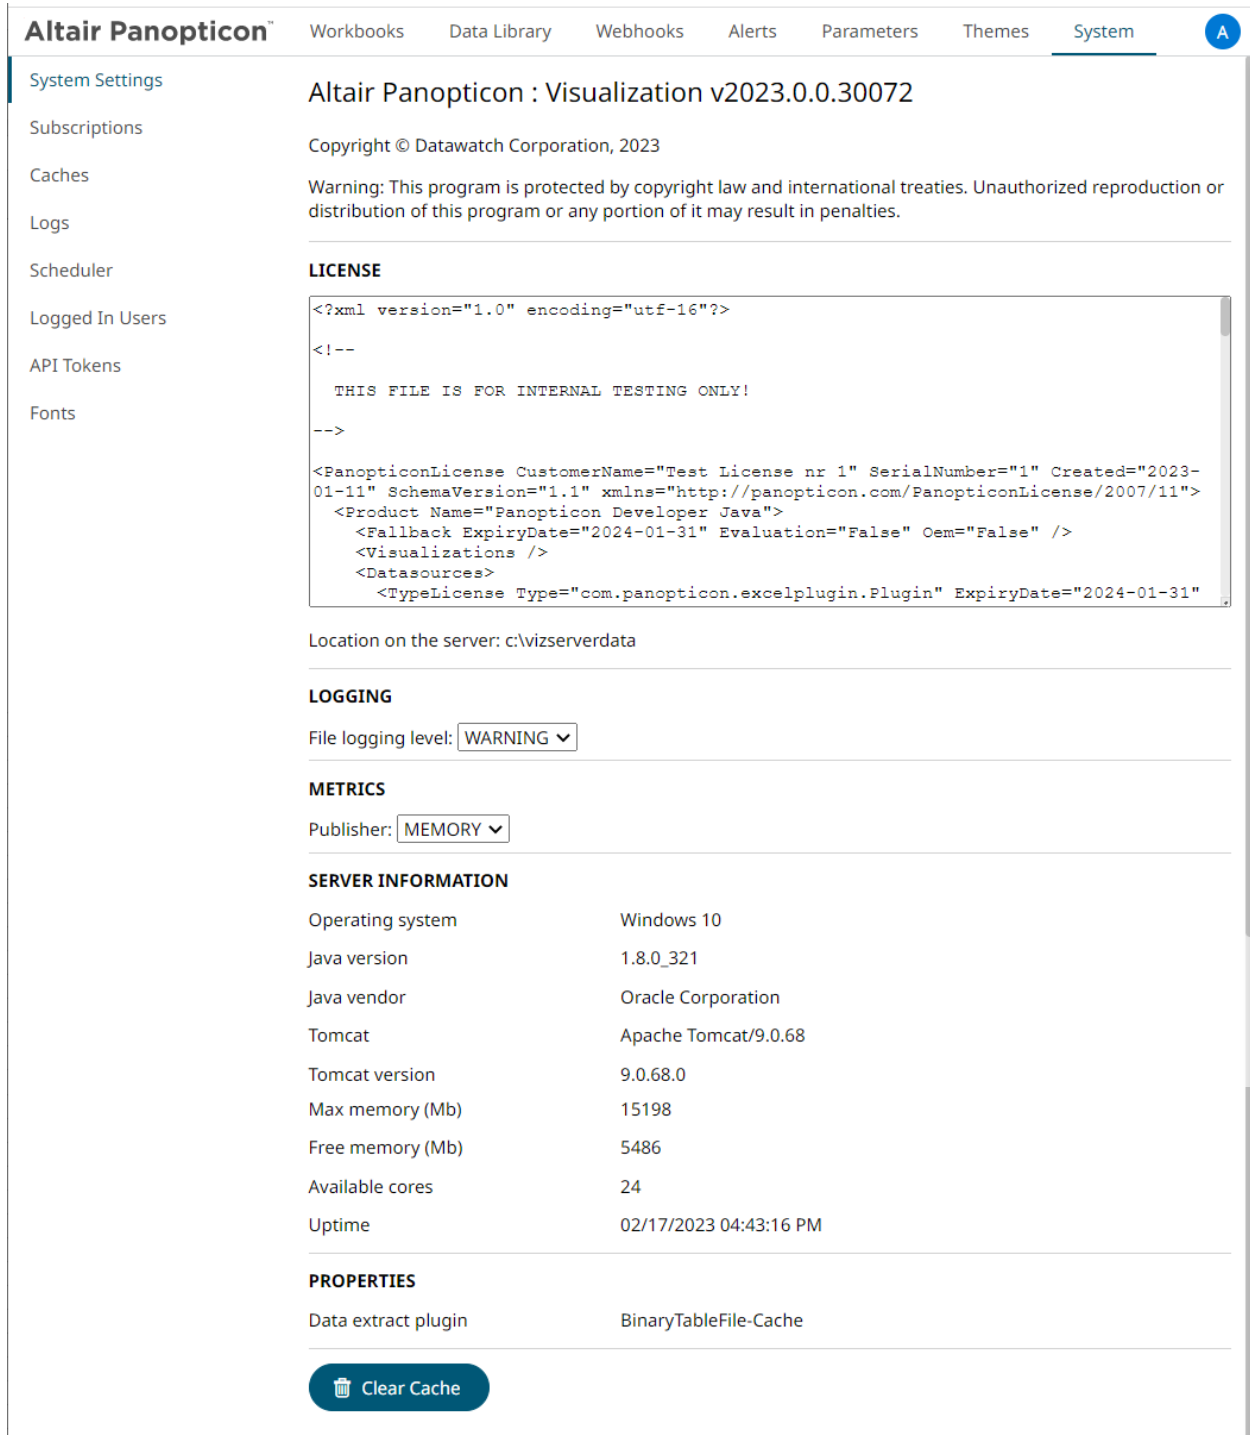

The image shows a dialog box titled "Parameter" with a close button (X) in the top right corner. It contains three input fields: "Name" with the value "id", "Default Value" with five black dots, and "Is Encrypted" with a checked checkbox. At the bottom, there are "OK" and "Cancel" buttons.

This parameter can then be used to restrict the data being retrieved, though use in either:

- Connection Details to Data Sources
- Filter constraints on data queries (e.g., SQL WHERE Clauses)

[7] SYSTEM ADMINISTRATION

Panopticon Real Time system administration is done on the following pages of the **System** tab:

Setting the File Logging Level

The current set level (e.g., **FINEST**) is displayed. To change, click the drop-down list and select another log level.

The new log level is written in the `Panopticon.properties` file:

```
logger.level.file=WARNING
```

Setting the Server Metrics Publisher

The server performance metrics can be used to report, monitor, and configure the server's health and limits. The collected metrics may include the following information:

- Long polling, WebSocket, and total number of connections
- CPU loading percentage
- Maximum, size, and used Heap Bytes
- Subscription alerts, users, and total
- Number of parallel data loading and live threads
- Average data load time or refresh rate

On the *Metrics* section of the *System Settings* page, select the *Publisher* of the server performance metrics.

METRICS

Publisher: NONE ▾

- NONE
- MEMORY
- FILE

Metrics Publisher	Description
None	No metrics are published.
Memory	Metrics are published to a queue in memory.
File	Metrics are published to a file on disk located in the AppData/Metrics/ folder (i.e., c:\vizserverdata\Metrics).

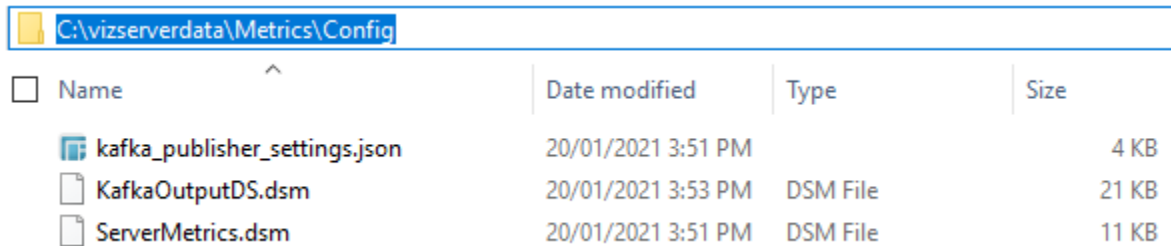

To add other Kafka publishers in the drop-down list, ensure their configuration file are available in the AppData/Metrics/Config folder.

A configuration file can be generated by creating a new [data source](#) in the Panopticon Streams Server and selecting any of the *Output* connectors. You can either:

- export the JSON file from the repository, or
- download the DSM file by right-clicking the **Data Source** and clicking **Download** on the context menu

Refer to the [Panopticon Streams Server Installation and Reference Guide](#) for more information.

For example, when the generated Kafka data sources are added in the AppData/Metrics/Config folder:

Name	Date modified	Type	Size
kafka_publisher_settings.json	20/01/2021 3:51 PM		4 KB
KafkaOutputDS.dsm	20/01/2021 3:53 PM	DSM File	21 KB
ServerMetrics.dsm	20/01/2021 3:51 PM	DSM File	11 KB

The ID of the new configuration files are displayed in the *Publisher* drop-down list.

METRICS

Publisher: KafkaMetricsPublisher ▼

- NONE
- MEMORY
- FILE
- KafkaMetricsPublisher**
- KafkaOutputDS
- ServerMetrics

Selecting any of these specific Kafka data sources means that this is only place where metrics will be published to.

View Panopticon Real Time Information

On the *System Settings* page, the following server information are displayed:

Server Property	Description
Operating System	The server host operating system .
Java Version	The version of the Java Runtime Environment.
Java Vendor	The vendor of the Java Runtime Environment.
Tomcat	Identifies the Tomcat hosting the server
Tomcat Version	The Tomcat version.
Tomcat Memory (Mb)	The total amount of memory available to the Java Virtual Machine.
Max Memory (Mb)	The maximum amount of memory that the Java Virtual Machine will attempt to use.
Free Memory (mb)	The amount of free memory in the Java Virtual Machine.
Available Cores	The number of cores available to the Java Virtual Machine.
Uptime	The time when Panopticon Real Time was last started.

VIEW PLUGIN SUBSCRIPTIONS

View all of the currently running real-time plugin subscriptions.

The screenshot shows the Altair Panopticon interface. The top navigation bar includes 'Workbooks', 'Data Library', 'Webhooks', 'Alerts', 'Parameters', 'Themes', and 'System'. The 'System' tab is active, showing 'System Settings' on the left sidebar. The main content area is titled 'Subscriptions' and features a table with the following data:

Data Source	Workbooks	Datatables	#Rows	#Columns	Time Slices	
KafkaPlugin	StocksAnalysis	8a633bc2-5bb3-47cb-aed9-d9afb239ed73	0	13	0	×
PanopticonStreamsPlugin	BidOfferTrade	2c76103e-fd4b-40a3-9a2c-7b903eeaba7f	0	13	0	×
KDBPlusTickPlugin	ecs_kx	vordersfororderid	6	85	0	×
KDBPlusTickPlugin	ecs_kx	orderswithcalcs	297	82	0	×

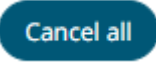

Below the table is a 'Preview Subscriptions' section with a search bar and a list of data sources: KafkaPlugin, KDBPlusTickPlugin, and KDBPlusTickPlugin. A 'Cancel all' button is located in the top right corner of the subscriptions section.

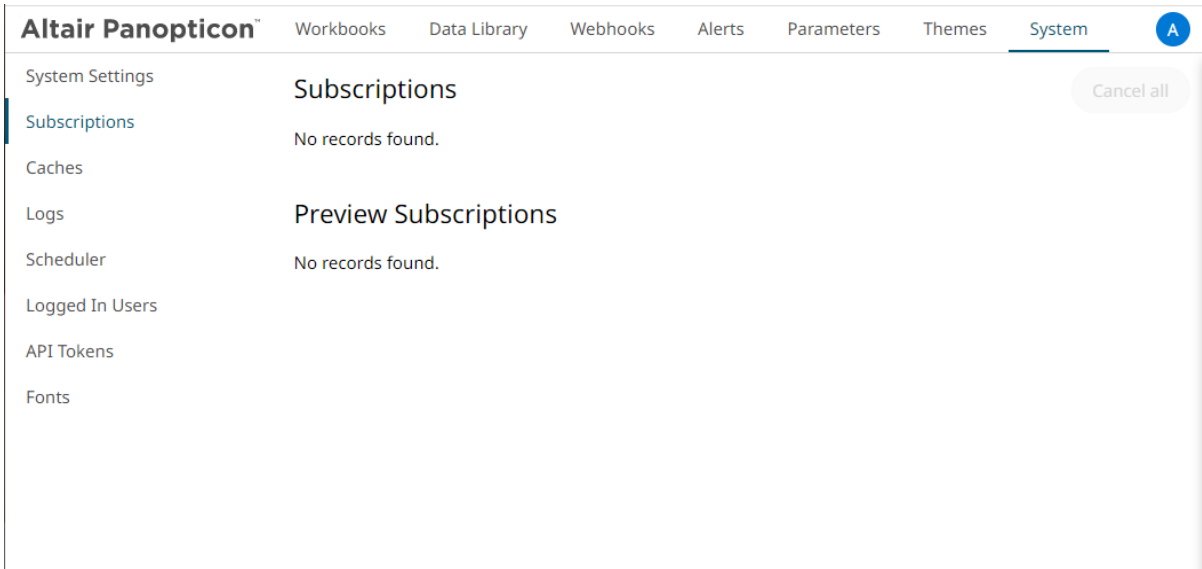

Including the following information:

- Data source with an installed plugin
- Workbook name
- Data table name
- Current size of the real-time table held by the plugin such as number of rows, columns, and time slices

For subscriptions created by ad hoc services, or those with no owner (workbook reference), they can be viewed on the *Preview Subscriptions* section.

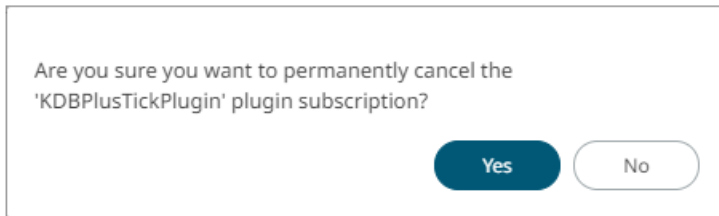

You can also opt to do any of the following:

- Click **Cancel All**  to cancel all of the subscriptions on the *Subscriptions* section.

- ❑ Cancel a plugin subscription by clicking 

A notification message displays.

Click  to cancel.

- ❑ Move to other pages

VIEW CACHE USAGE

View the caches currently in use on the server.

Workbook Name	Data Table Title	Datasource Name	Read Count	Cell Count	Response Length	Cache age	Expires in
How to Non Additive	MultiHierarchy		2	552	0	a few seconds	14 minutes
~designer\How to Filter	Example - StocksStatic		2	56000	0	5 minutes	9 minutes
~designer\Order Book	Filtered Orderbook		1	170	0	5 minutes	9 minutes
~designer\Order Book	orderbook		3	123150	0	5 minutes	9 minutes
How to Non Additive	TimeSeries		6	6026	0	a few seconds	14 minutes
How to Actions	Filtered Equity Universe		1	2048	0	5 minutes	9 minutes
How to Actions	Equity Portfolio		8	56000	0	5 minutes	9 minutes
~designer\Order Book	orderbook	OrderBook_OrderBook	1	83742	0	5 minutes	9 minutes
~designer\Order Book	Filtered Orderbook	OrderBook_OrderBook	1	170	0	5 minutes	9 minutes
How to Non Additive	MultiHierarchy	NonAdditive_MultiHierarchy	1	2292	0	a few seconds	14 minutes

The *Cache Usage* list includes the following information:

- Cache rendering type
- Workbook Name
- Data Table Title
- Data Source Name
- Read Count
- Cell Count
- Response Length
- Cache Age
- Time to Live (Expires In)

You can also opt to do the following:

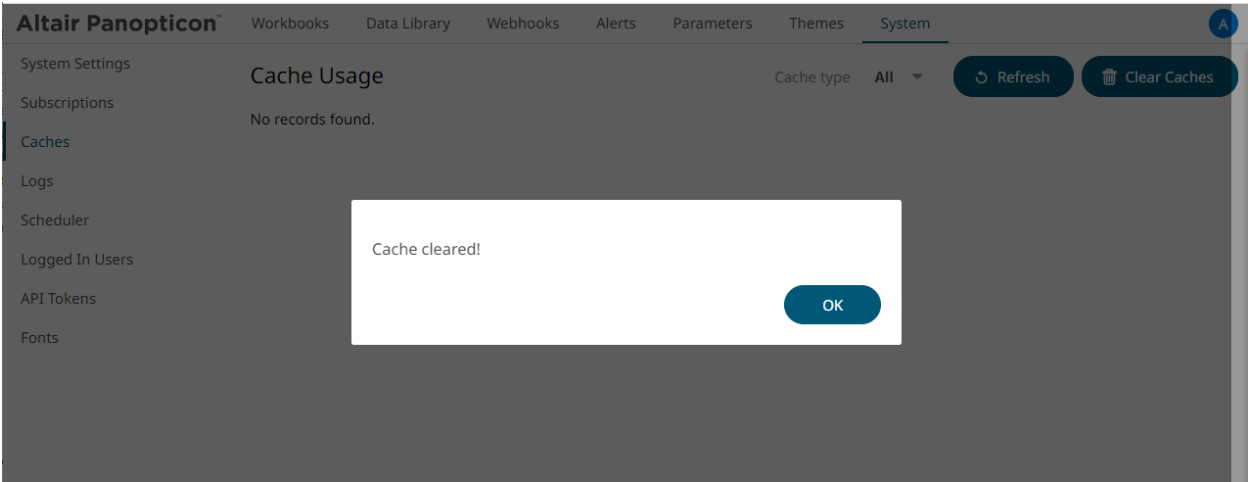

- Clear Cache and refresh page
- Display Data Table Cache
- Display Data Source Cache
- Display Query Cache
- Move to other pages

Click the **Refresh** button to refresh the list.

Clicking **Clear Cache** will clear all caches of data, ensuring that any subsequent workbook access that utilizes a cache, will cause a cache reload.

Select a *Cache Type* to display in the list.

Data Table Cache Type

Cache Usage							Cache type	Refresh	Clear Caches
Workbook Name	Data Table Title	Datasource Name	Read Count	Cell Count	Refresh Count	Cache age	Expires in		
How to Non Additive	MultiHierarchy		2	552	0	12 minutes	2 minutes		
How to Non Additive	TimeSeries		6	6026	0	12 minutes	2 minutes		

❑ Data Source Cache Type

Workbook Name	Data Table Title	Datasource Name	Read Count	Cell Count	Cache type	Cache age	Expires in
How to Non Additive	TimeSeries		1	0	2892	12 minutes	2 minutes
How to Non Additive	MultiHierarchy		1	0	4988	12 minutes	2 minutes

VIEW LOGS

View the latest 300 rows of a *Logging Level* in the **Logs** tab:

- FINEST (lowest level)
- FINER
- FINE
- CONFIG
- INFO (default level)
- WARNING
- SEVERE (highest level)

Steps:

1. On the *System* page, click the **Logs** tab. Initially, the default level (**INFO**) logs are displayed.

The screenshot shows the Altair Panopticon System page. The 'Logs' tab is active, displaying a list of log entries. The logging level is set to 'INFO'. The log entries include a stack trace for a PyroProxy call and several INFO messages from the DataPluginUtils and TextPluginBase classes, detailing file reads and data retrieval times.

SCHEDULING TASKS

On the **Scheduler** tab of the *System Settings* page, Panopticon Real Time allows scheduling of tasks.

A new scheduled task is added in the list with the properties.

Scheduler Property	Description
1	Run Task Manually run scheduler task.
2	Upload Task Upload scheduler task.
3	New Task Create a new scheduler task.
4	Delete Task Delete a scheduler task.
5	Download Task Download a scheduler task.
6	Task Properties The task properties include: <ul style="list-style-type: none"> • Name of the task • Activated status • Type of the scheduled task • Trigger type: Period or CRON • Last user who made an update • Date/Time when the task was created • Date/Time when the task was last ran • Last run result: Success or Failed For failed results, you can hover on the tooltip to view the error. NOTE: The result is not displayed for Extract Data scheduler type.

+ New Task

To create a new task, click **New Task**. The *New Task* pane displays that allows you to define the following tasks:

←

Task0 Run Save

Activated

Trigger Period CRON

Interval (sec) 3600

- [Sending of an Image file via Email](#)
- [Sending of a PDF file via Email](#)

❑ [Extracting Data](#)

NOTE

- To allow scheduling of email send outs, Panopticon Real Time must be configured with valid email server information in the `Panopticon.properties` file located in the `AppData` folder (e.g., `c:\vizserverdata`).
See [Panopticon Real Time Configurations for Email Send Outs and Alerts](#) for instructions.
- If any data load fails, such as when the data source is offline, the PDF/Image generation fails as well, and an email will not be sent.

Create Task to Clear and Import Data Table to Data Store

Allows you to clear the earlier imported data and import again to the data store.

Steps:

1. On the *New Task pane*, enter the *Name* of the task. Ensure the name is unique.
2. Tap the *Activated* slider to turn it on.
3. Select the *Trigger*. You can either select:

- Period then enter the *Interval* (in seconds), or

Trigger	<input checked="" type="radio"/> Period	<input type="radio"/> CRON
Interval (sec)	<input type="text" value="3600"/>	

- **CRON** then enter the CRON Expression.

Trigger	<input type="radio"/> Period	<input checked="" type="radio"/> CRON
CRON Expression	<input type="text"/>	

4. Select the task *Type*: **Data Store – Clear and Import**.
5. Enter the *Description* of the task.
6. Select the *Data Table Name* that will be cleared in the data store and imported again.

7. Click

- Once saved, you can opt to click  to manually run the task.
- Click  to go back to the *Tasks* pane. The new task is added in the list.

Create Task to Import Data Table to Data Store

Allows you to store data closer to Panopticon server in an embedded database.

Steps:

1. On the *New Task pane*, enter the *Name* of the task. Ensure the name is unique.
2. Tap the *Activated* slider to turn it on.
3. Select the *Trigger*. You can either select:

- **Period** then enter the *Interval* (in seconds), or

Trigger	<input checked="" type="radio"/> Period	<input type="radio"/> CRON
Interval (sec)	<input type="text" value="3600"/>	

- **CRON** then enter the CRON Expression.

Trigger	<input type="radio"/> Period	<input checked="" type="radio"/> CRON
CRON Expression	<input type="text"/>	

4. Select the task *Type*: **Data Store – Import Data**.
5. Enter the *Description* of the task.
6. Select the *Data Table Name* that will be imported in the data store.

7. Click

- Once saved, you can opt to click  to manually run the task.
- Click  to go back to the *Tasks* pane. The new task is added in the list.

Create Task to Send CSV Data via Email

Panopticon Real Time provides the functionality to create tasks to generate and email CSV data from a workbook, dashboard, or visualization.

Steps:

1. On the *New Task pane*, enter the *Name* of the task. Ensure the name is unique.
2. Tap the *Activated* slider to turn it on.
3. Select the *Trigger*. You can either select:

- **Period** then enter the *Interval* (in seconds), or

Trigger	<input checked="" type="radio"/> Period	<input type="radio"/> CRON
Interval (sec)	<input type="text" value="3600"/>	

- **CRON** then enter the CRON Expression.

Trigger Period CRON

CRON Expression _____

4. Select the task *Type*: **Email CSV Data**.
5. Enter the *Description* of the task.
6. Upon selecting **Email CSV Data**, the *Scheduler* page changes to allow specification of the following:
 - Select the *Workbook Name* in the drop-down list. These are the published workbooks available in the *Workbooks* page.
 - Select dashboards or parts where to source the CSV data from, by checking their corresponding boxes in the *Dashboards & Parts* drop-down list.

<p>Dashboards & Parts</p> <p>Parameter Values</p> <p>Output File Names</p> <p>Zip CSV Data</p> <p>Email</p> <p>To ?</p> <p>CC ?</p> <p>BCC ?</p> <p>Subject</p> <p>Body</p>	<p style="color: #00a651;">Industry Performance by Region, Regional Performance</p> <div style="border: 1px solid #ccc; padding: 5px;"> <p><input type="checkbox"/> How To Actions</p> <p><input checked="" type="checkbox"/> Industry Performance by Region</p> <p><input checked="" type="checkbox"/> Regional Performance</p> <p><input checked="" type="checkbox"/> Industry Performance</p> <p><input type="checkbox"/> Navigation Target</p> <p><input checked="" type="checkbox"/> Scatter of Filtered Universe for {Region:</p> <p><input type="checkbox"/> Action Controls - Single Value</p> <p><input type="checkbox"/> Action Controls - Multiple values</p> <p><input type="checkbox"/> Numeric Range</p> <p><input type="checkbox"/> Action Controls - Form</p> <p><input type="checkbox"/> Action Controls - Datetime</p> <p><input type="checkbox"/> Data Entry</p> <p><input checked="" type="checkbox"/> Treemap1</p> <p><input type="checkbox"/> Time Parameters</p> <p><input checked="" type="checkbox"/> Start: {TWS: yyyy-MMM-dd} End = {TW</p> <p><input type="checkbox"/> Data-driven Parameters</p> </div>
---	--

- You can also opt to enter the *Parameter Values* that will be added as parameters to the subject line of emails or as dashboard values in the CSV Data.

Such as `Parameter=Value`, and are comma separated. For example:

`Region=Europe, Industry=Financials`

NOTE

- See [Setting Parameter Values in Scheduler Tasks](#) for more information on the different syntax you can use to enter parameters with multiple values, as well as parameter values that contain comma.
- The following Date/Time range querying parameters are also supported in the Email CSV Data task:
 - CurrentTime
 - LastWorkDay
 - WeekStart
 - QuarterStart

For example:

```
{CurrentTime:dd-MMM-yyyy}
```

However, when there is no Date/Time format supplied, the default format yyyy-MM-dd will be used instead.

- enter comma-separated list of *Output File Names*.

NOTE

- The items in the list must be either unique or empty.
- Empty string items indicate that the default title should be used.
- By default, the text box is blank causing the implicit naming to be used.
- If the supplied names are fewer than the selected data sets, the default naming comes into effect for non-specified names.

7. You can opt to tap the **Zip CSV Data** slider to attach a zipped copy of the CSV data in the email.
8. Enter the email address of the recipient in the *To* field.
9. You can opt to enter the following:
 - the *CC* and/or *BCC* recipients of the email separated by a comma.
 - the mail message subject to be used in the email notifications in the *Subject* field.

NOTE

Supports dashboard parameters.

- the content of the email in the *Body* box.

10. Click  .

- Once saved, you can opt to click  to manually run the task.
- Click  to go back to the *Tasks* pane. The new task is added in the list.

Create Task to Send an MS Excel File via Email

Panopticon Real Time provides the functionality to create tasks to generate and email MS Excel files.

Steps:

1. On the *New Task pane*, enter the *Name* of the task. Ensure the name is unique.
2. Tap the *Activated* slider to turn it on.
3. Select the *Trigger*. You can either select:

- **Period** then enter the *Interval* (in seconds), or

Trigger	<input checked="" type="radio"/> Period	<input type="radio"/> CRON
Interval (sec)	<input type="text" value="3600"/>	

- **CRON** then enter the CRON Expression.

Trigger	<input type="radio"/> Period	<input checked="" type="radio"/> CRON
CRON Expression	<input type="text"/>	

4. Select the task *Type*: **Email Excel**.

Upon selecting **Email Excel**, the *Scheduler* page changes to allow specification of the following:

- Enter the *Description* of the task.
- Select the *Workbook Name* in the drop-down list. These are the published workbooks available in the *Workbooks* page.
- Select the dashboards to include in the MS Excel file by checking their corresponding boxes in the *Dashboards* drop-down list.

NOTE Multiple tables per dashboard are inserted in a sheet of the MS Excel file.

5. You can also opt to:

- enter the *Parameter Values* that will be added as parameters to the subject line of emails or as dashboard values in the MS Excel file

Such as `Parameter=Value`, and are comma separated. For example:

`Region=Europe, Industry=Financials`

NOTE

- See [Setting Parameter Values in Scheduler Tasks](#) for more information on the different syntax you can use to enter parameters with multiple values, as well as parameter values that contain comma.
- The following Date/Time range querying parameters are also supported in the Email CSV Data task:

- CurrentTime
- LastWorkDay
- WeekStart
- QuarterStart

For example:

```
{CurrentTime:dd-MMM-yyyy}
```

However, when there is no Date/Time format supplied, the default format yyyy-MM-dd will be used instead.

- check the **Hide Scrollbars** box.
6. Enter the *Width* and *Height* of the MS Excel file. Default values are **1024px** and **768px**, respectively.
 7. Enter the *Table Style*. Default is **TableStyleMedium4**.
 8. Enter the email address of the recipient in the *To* field.
 9. You can opt to enter the following:
 - the *CC* and/or *BCC* recipients of the email separated by a comma.
 - the mail message subject to be used in the email notifications in the *Subject* field.

NOTE

Supports dashboard parameters.

- the content of the email in the *Body* box.

10. Click  .

- Once saved, you can opt to click  to manually run the task.
- Click  to go back to the *Tasks* pane. The new task is added in the list.

Create Task to Send an HTML Formatted Data via Email

Panopticon Real Time provides the functionality to create tasks to generate and email HTML-formatted table exported from a selected workbook and dashboards.

IMPORTANT

Use with caution! When emailing HTML formatted data, the email message size runs the risk of becoming very large if the data used in the visualization is too large and/or complex. The data volume will not stop Panopticon Real Time from creating the message and the HTML-formatted data, but email servers may struggle to send and/or receive the message.

Steps:

1. On the *New Task pane*, enter the *Name* of the task. Ensure the name is unique.
3. Tap the *Activated* slider to turn it on.
4. Select the *Trigger*. You can either select:

- **Period** then enter the *Interval* (in seconds), or

Trigger	<input checked="" type="radio"/> Period	<input type="radio"/> CRON
Interval (sec)	<input type="text" value="3600"/>	

- **CRON** then enter the CRON Expression.

Trigger	<input type="radio"/> Period	<input checked="" type="radio"/> CRON
CRON Expression	<input type="text"/>	

5. Select the task *Type*: **Email HTML Formatted Data**.

Upon selecting **Email HTML Formatted Data**, the *Scheduler* page changes to allow specification of the following:

- Enter the *Description* of the task.
 - Select the *Workbook Name* in the drop-down list. These are the published workbooks available in the *Workbooks* page.
 - Select the dashboards and parts to include in the HTML formatted data file by checking their corresponding boxes in the *Dashboards & Parts* drop-down list.
6. You can also opt to enter the *Parameter Values* that will be added as parameters to the subject line of emails or as dashboard values in the MS Excel file.

Such as `Parameter=Value`, and are comma separated. For example:

`Region=Europe, Industry=Financials`

NOTE

- See [Setting Parameter Values in Scheduler Tasks](#) for more information on the different syntax you can use to enter parameters with multiple values, as well as parameter values that contain comma.
- The following Date/Time range querying parameters are also supported in the Email CSV Data task:

- CurrentTime
- LastWorkDay
- WeekStart
- QuarterStart

For example:

```
{CurrentTime:dd-MMM-yyyy}
```

However, when there is no Date/Time format supplied, the default format yyyy-MM-dd will be used instead.

7. Enter the email address of the recipient in the *To* field.
8. You can opt to enter the following:
 - the *CC* and/or *BCC* recipients of the email separated by a comma.
 - the mail message subject to be used in the email notifications in the *Subject* field.

NOTE

Supports dashboard parameters.

- the content of the email in the *Body* box.

9. Click  .

- Once saved, you can opt to click  to manually run the task.
- Click  to go back to the *Tasks* pane. The new task is added in the list.

Create Task to Send Image File via Email

Panopticon Real Time provides the functionality to create tasks to generate and email Image files.

In addition, hyperlinks can also be used in email dashboard images. Hyperlinks can redirect to a workbook and a dashboard in the server.

NOTE

In cases when you schedule the emailing of dashboard images or when you are behind a proxy or load balancer, it is recommended to specify the server address in the `Panopticon.properties` file.

For example: `server.host=http://www.company.com/dashboards/`

See the [Email Data: Image](#) section for more information.

Steps:

1. On the *New Task pane*, enter the *Name* of the task. Ensure the name is unique.
2. Tap the *Activated* slider to turn it on.
3. Select the *Trigger*. You can either select:

- **Period** then enter the *Interval* (in seconds), or

Trigger	<input checked="" type="radio"/> Period	<input type="radio"/> CRON
Interval (sec)	<input type="text" value="3600"/>	

- **CRON** then enter the CRON Expression.

Trigger	<input type="radio"/> Period	<input checked="" type="radio"/> CRON
CRON Expression	<input type="text"/>	

4. Select the task *Type*: **Email Image**.

Upon selecting **Email Image**, the *Scheduler* page changes to allow specification of the following:

- Enter the *Description* of the task.
- Select the *Workbook Name* in the drop-down list. These are the published workbooks available in the *Workbooks* page.
- Select dashboards or parts to include in the image file by checking their corresponding boxes in the *Dashboards & Parts* drop-down list.

Candlestick

Image placeholder for Candlestick

- Select bookmarks in the workbook to include in the image file by checking their corresponding boxes in the *Bookmarks* drop-down list.
5. You can also opt to:
- enter the *Parameter Values* that will be added as parameters to the subject line of emails or as dashboard values in the Image file

Such as `Parameter=Value`, and are comma separated. For example:

`Region=Europe, Industry=Financials`

NOTE

- See [Setting Parameter Values in Scheduler Tasks](#) for more information on the different syntax you can use to enter parameters with multiple values, as well as parameter values that contain comma.
- The following Date/Time range querying parameters are also supported in the Email CSV Data task:
 - CurrentTime
 - LastWorkDay
 - WeekStart
 - QuarterStart

For example:

```
{CurrentTime:dd-MMM-yyyy}
```

However, when there is no Date/Time format supplied, the default format `yyyy-MM-dd` will be used instead.

- enter the *Width* and *Height* of the Image file. Default values are **1024** and **768**, respectively.
 - check the **Hide Scrollbars** box.
 - check the **Hyperlinks** box. This makes the Image file in the email will be clickable.
6. Enter the email address of the recipient in the *To* field.

- You can opt to enter the following:
 - the *CC* and/or *BCC* recipients of the email separated by a comma.
 - the mail message subject to be used in the email notifications in the *Subject* field.

NOTE Supports dashboard parameters.

- the content of the email in the *Body* box.

- Click  .

- Once saved, you can opt to click  to manually run the task.
- Click  to go back to the *Tasks* pane. The new task is added in the list.

Create Task to Send PDF File via Email

Panopticon Real Time provides the functionality to create tasks to generate and email PDF files.

Steps:

- On the *New Task pane*, enter the *Name* of the task. Ensure the name is unique.
- Tap the *Activated* slider to turn it on.
- Select the *Trigger*. You can either select:

- Period** then enter the Interval (in seconds), or

Trigger	<input checked="" type="radio"/> Period	<input type="radio"/> CRON
Interval (sec)	<input type="text" value="3600"/>	

- CRON** then enter the CRON Expression

Trigger	<input type="radio"/> Period	<input checked="" type="radio"/> CRON
CRON Expression	<input type="text"/>	

- Select the task *Type*: **Email PDF**.
- Upon selecting **Email PDF**, the *Scheduler* page changes to allow specification of the following:
 - Enter the *Description* of the task.
 - Select the *Workbook Name* in the drop-down list. These are the published workbooks available on the *Workbooks* page.
 - Select dashboards to include in the PDF by checking their corresponding boxes in the *Dashboards* drop-down list.
- Select bookmarks in the workbook to include in the PDF by checking their corresponding boxes in the *Bookmarks* drop-down list.

8. You can also opt to:

- enter the *Parameter Values* that will be added as parameters to the subject line of emails or as dashboard values in the PDF file.

Such as `Parameter=Value`, and are comma separated. For example:

`Region=Europe,Industry=Financials`

NOTE

- See [Setting Parameter Values in Scheduler Tasks](#) for more information on the different syntax you can use to enter parameters with multiple values, as well as parameter values that contain comma.
- The following Date/Time range querying parameters are also supported in the Email CSV Data task:

- `CurrentTime`
- `LastWorkDay`
- `WeekStart`
- `QuarterStart`

For example:

`{CurrentTime:dd-MMM-yyyy}`

However, when there is no Date/Time format supplied, the default format `yyyy-MM-dd` will be used instead.

- check the **Enable Pagination** box.
- check the **Hide Scrollbars** box.

9. Enter the email address of the recipient in the *To* field.

10. You can opt to enter the following:

- the *CC* and/or *BCC* recipients of the email separated by a comma.
- the mail message subject to be used in the email notifications in the *Subject* field.

NOTE

Supports dashboard parameters.

- the content of the email in the *Body* box.

11. Click

- Once saved, you can opt to click  to manually run the task.
- Click  to go back to the Tasks pane. The new task is added in the list.

Create Task to Extract Data

Tasks can be created to reload workbook or global extracts.

Steps:

1. On the *New Task pane*, enter the *Name* of the task. Ensure the name is unique.
2. Tap the *Activated* slider to turn it on.
3. Select the *Trigger*. You can either select:

- *Period* then enter the *Interval* (in seconds), or

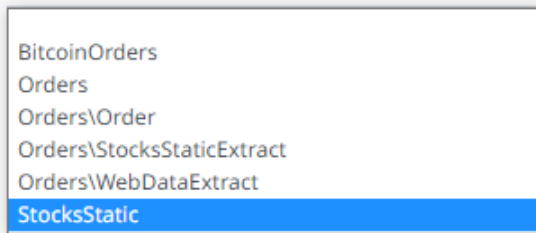

Trigger	<input checked="" type="radio"/> Period	<input type="radio"/> CRON
Interval (sec)	<input type="text" value="3600"/>	

- CRON then enter the CRON Expression

Trigger	<input type="radio"/> Period	<input checked="" type="radio"/> CRON
CRON Expression	<input type="text"/>	

4. Select the task *Type*: **Extract Data**.
5. Enter the *Description* of the task.
6. Select the data extract to be scheduled in the *Extract Name* drop-down list box. The list is taken from the data extracts list on the **Extracts** tab.

Extract name 

- BitcoinOrders
- Orders
- Orders\Order
- Orders\StocksStaticExtract
- Orders\WebDataExtract
- StocksStatic**

7. Click 

- Once saved, you can opt to click  to manually run the task.
- Click  to go back to the *Tasks* pane. The new task is added in the list.

Setting Parameter Values in Scheduler Tasks

Use any of the following syntax to define parameter values in scheduler tasks:

- For multiple values (array parameter), use bracket syntax
Example: `parameter1=[Value1, Value2, Value3]`
- For a parameter with a value containing comma, quote the value in double quotes

Example: `parameter1="Parameter value, containing comma"`

- ❑ The double quoting can also be used inside arrays

Example: `parameter1=[Value1, "Value2, containing comma"]`

- ❑ Normal parameters, quoted parameters, and array parameters can be mixed

Example: `parameter1=Normal,parameter2=[Val1,Val2],parameter3="Quoted Value"`

Uploading a Scheduler Task

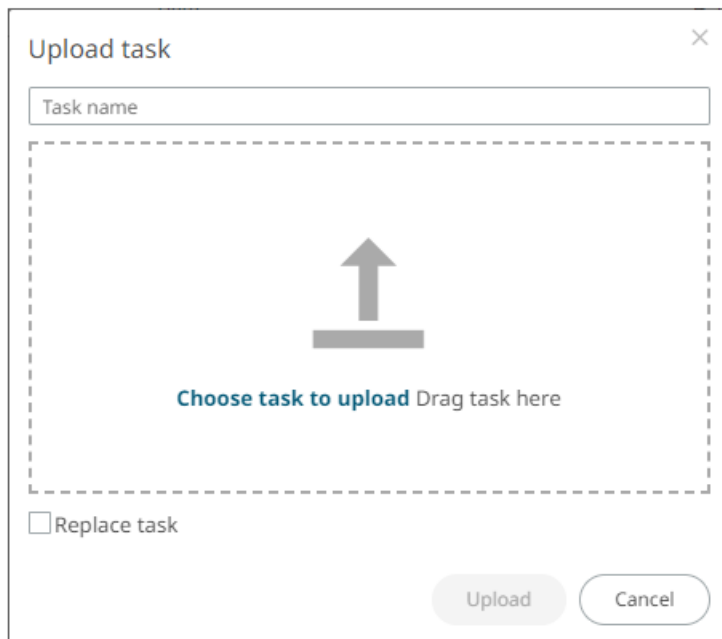

Users with an Administrator role can upload scheduler task definitions.

Steps:

1. On the **Scheduler** tab, click **Upload**

The *Upload Task* dialog displays.

2. To upload a task, you can either:
 - drag it from your desktop and drop on the dialog, or
 - click **Choose task to upload** and select one on the *Open* dialog that displays.

The name of the task is displayed on the uploaded task area and in the *Name* box.

3. You can opt to rename the task.
4. To replace an existing task, check the **Replace task** box.

5. Click  .

You will be notified once the task is uploaded.

The task is added and displayed in the *Scheduler* list.

Downloading a Scheduler Task

Users with an Administrator role can download scheduler task definitions.

Click the **Download**  icon of a task.

Other Scheduler Tasks Operations

On the **Scheduler** tab of the *System Settings* page, you can also perform the following:

Sort tasks

A task displays the following columns: *Name*, *Activated*, *Type*, *Trigger*, *Last Updated By*, *Created*, and *Last Run*.

Modify the sorting of the list by clicking the  or  button of any of these columns. The icon beside the column that was used for the sorting will indicate if it was in an ascending or descending order.

Manually run tasks

Instead of waiting for the set Period interval or CRON Expression, you can manually execute the task by clicking

The *Last Run* and *Last Run Result* (**Success** or **Failed**) are displayed. For failed results, you can hover on the tooltip to view the error.

[Modify](#) tasks

Delete tasks

Click  of a task. A confirmation message displays.

Are you sure you want to delete the task?

Click .

Modify a Scheduled Task

Steps:

1. On the **Scheduler** tab, click the link of a task to modify.
The properties of the task are displayed.

2. Apply the desired changes.

3. Click .

MANAGING PANOPTICON REAL TIME USERS

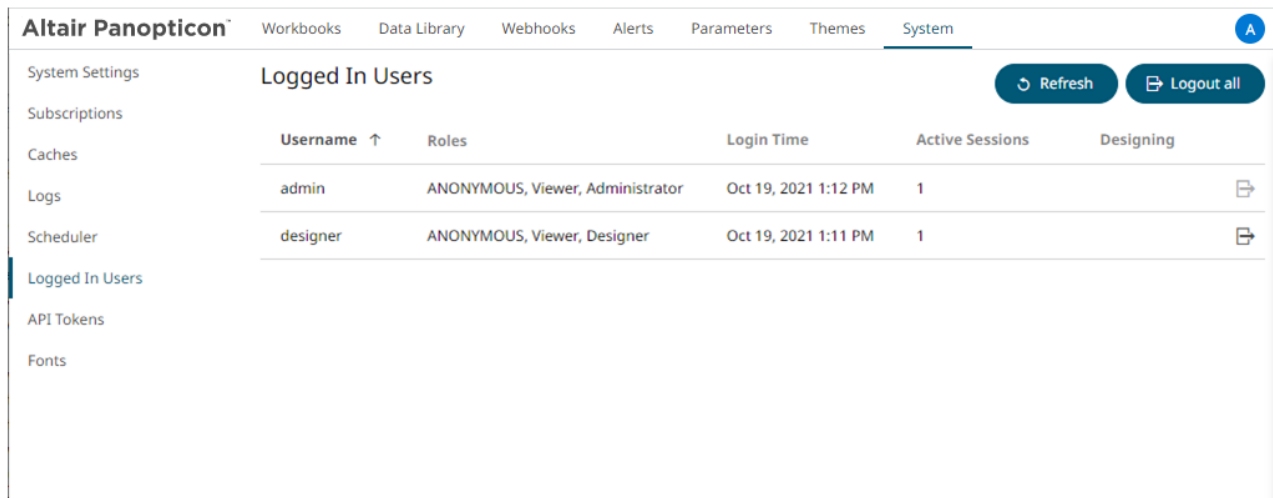

Users with an Administrator role can view the logged in users on Panopticon Real Time and log them out when necessary. The ability to manage users is beneficial in monitoring the utilization of [Altair Units](#) license.

On the **Logged In Users** tab of the *System* page, Administrators can perform the following:

- [View](#) logged in users
- [Sort](#) logged in users
- [Log out](#) users
- [Refresh](#) the *Logged In Users* list

Viewing Logged In Users

On the *System* page, click the **Logged In Users** tab. The list of logged in users is displayed.

In the list, the following properties are displayed for each user:

Property	Description
Username	Username used to the login to Panopticon Real Time.
Roles	Roles assigned to the user.
Login Time	The Date/Time the user logged in.
Active Sessions	The number of tokens a user is using. For example, if the user is logged in from two different computers, he will have two active sessions. However, if the user has two tabs on one computer, they will share a token and the active sessions will be one.
Designing	Indicates if a logged in user is currently designing a workbook.

Sorting Logged In Users

Sorting the logged in users can be done through the *Username*, *Login Time*, or *Active Sessions* column name.

Steps:

1. On the *System* page, click the **Logged In Users** tab. The list of logged in users is displayed.
2. Click on the **Username**, **Login Time**, or **Active Sessions** column header then click the *Sort Order*:
 -  Ascending
 -  Descending

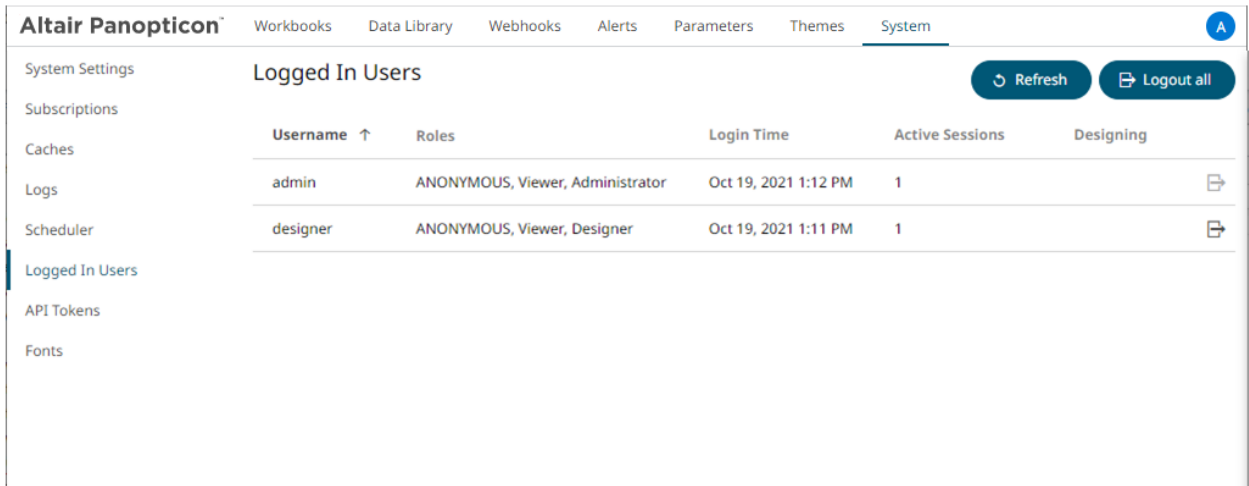

Logging Out Users

Logging out users on the server consequently deletes their tokens.

Logging Out All Users

Steps:

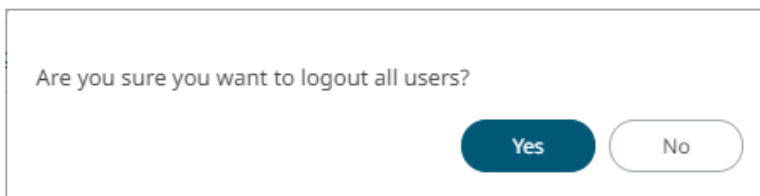

1. Click 

The screenshot shows the Altair Panopticon System page. The 'System' tab is selected, and the 'Logged In Users' section is active. A 'Logout all' button is visible in the top right corner of the section. Below the button is a table with the following data:

Username	Roles	Login Time	Active Sessions	Designing
admin	ANONYMOUS, Viewer, Administrator	Oct 19, 2021 1:12 PM	1	
designer	ANONYMOUS, Viewer, Designer	Oct 19, 2021 1:11 PM	1	

A notification message displays.

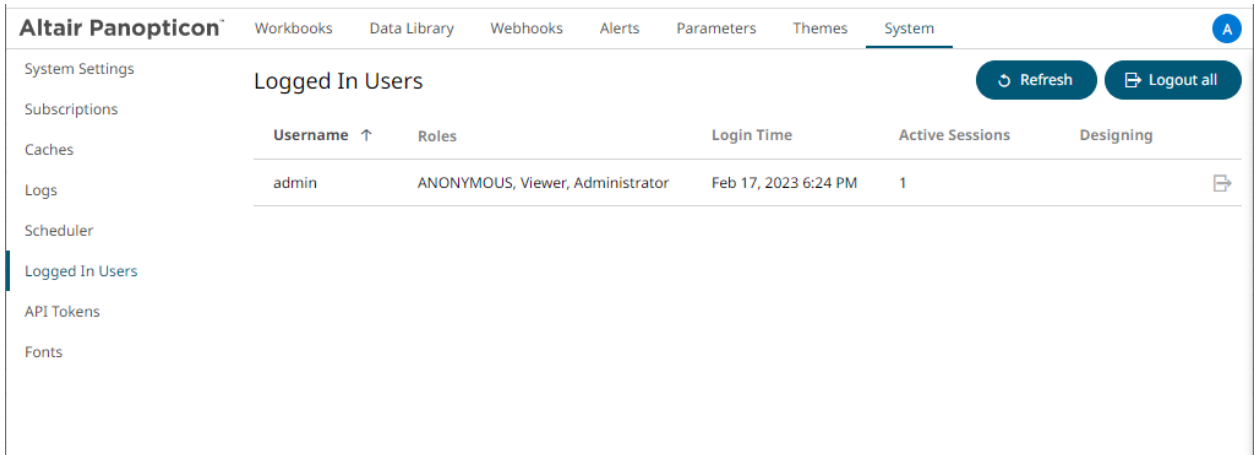

Are you sure you want to logout all users?

2. Click 

Except for the user (i.e., admin) who is calling out the logging out of the other users, all of the other users are logged out.

Also, the  button of admin is disabled.

Logging Out Individual Users

Steps:

1. Click the  button of a user in the list.

A notification message displays.

2. Click  .
The user is logged out and their token is deleted.

Refreshing the Logged In Users List

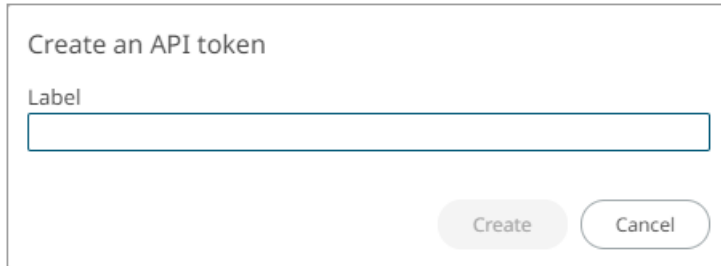

- Click  to refresh the list of logged in users.

MANAGING API TOKENS

On the *API Tokens* page, an Administrator user can add API Tokens that returns a key used for authorizing requests to the server.

Steps:

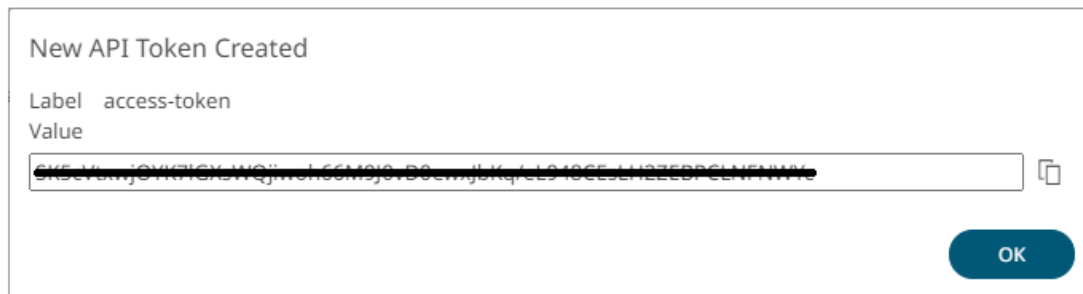

1. Click  **Create**. The *Create an API Token* dialog displays.

The dialog box is titled "Create an API token". It contains a text input field labeled "Label". Below the input field are two buttons: "Create" and "Cancel".

2. Enter the *Label*.

3. Click  **Create**. The *New API Token Created* dialog displays with the auto-generated key.

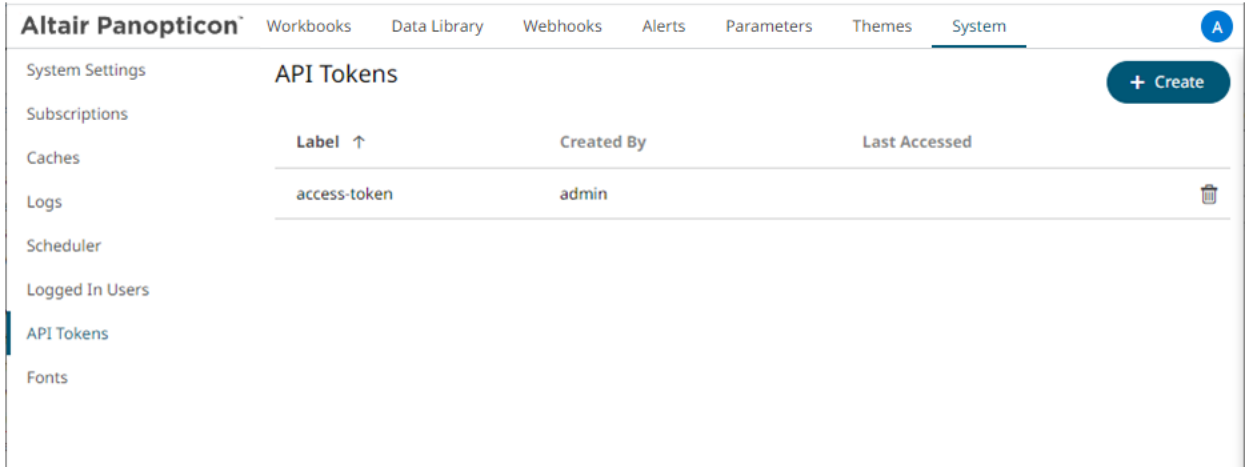

The dialog box is titled "New API Token Created". It displays the following information:

- Label: access-token
- Value:  [Redacted key]

At the bottom right of the dialog is an **OK** button.

NOTE The key will not be displayed again.

4. Click  to ensure you have a copy of the key and paste in a secure location.
5. Click  **OK**. The new API Token is displayed on the list.

In the list, the following properties are displayed for each API Token:

Property	Description
Label	Label of the API Token. NOTE: Select a label that is easy for you to remember.
Created By	The user who created the API Token. NOTE: Only Administrator users can create API Tokens. However, the keys can be used by anyone as long as they are not revoked.
Last Accessed	Date/Time when the API Token was last accessed.

Click on any of these column headers then click the *Sort Order* to sort the list.

-  Ascending
-  Descending

You can also opt to click  to remove and revoke the API Token from the server.

NOTE If the returned key is `key123`, then you can utilize the API services by setting an authorization header such as below:

```
Authorization="Bearer key123"
```

In the cURL, you can add a header flag such as:

```
-H "authorization: Bearer key123"
```

ADDING CUSTOM FONTS

Users with an Administrator role are allowed to add fonts on the **System** tab in Panopticon Real Time.

The supported custom font files include the following:

- ttf
- ofl

When available on the server, the client will automatically detect and load the font and consequently, can be used in a part or workbook. Otherwise, the client will fall back to the system installed fonts.

Steps:

1. Click . The *Add Fonts* dialog displays.

2. To add fonts, you can either:

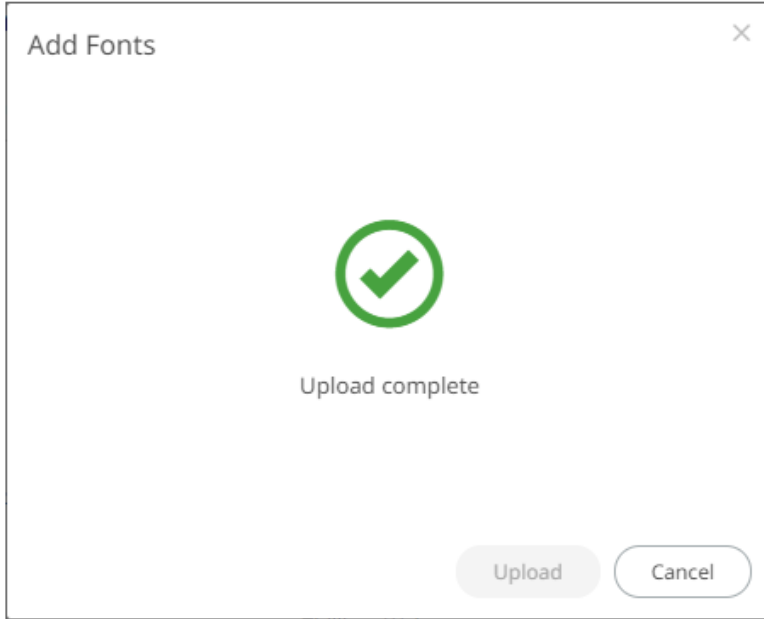

- drag them from your desktop and drop on the dialog, or
- click **Choose Fonts** and select one or more fonts on the *Open* dialog that displays.

The names or the number of fonts is displayed on the uploaded font area.

3. Click  .

A notification prompt will be displayed once the fonts are uploaded.

The added custom fonts are displayed on the *Fonts* page.

[8] CONNECTIVITY AND INTEGRATION

THIRD PARTY SOFTWARE DEPENDENCY INSTALLATION

Some data connectors require additional third-party software installation to be enabled which typically requires adding JAR files to the `lib` folder of the Tomcat installation and then restarting Tomcat.

Common additions include:

- JDBC Drivers
- Advanced Message Processing System (AMPS)

The latest version for AMPS can be downloaded from the 60East Technologies official website:
<http://www.crankuptheamps.com/amps/>

Copy `amps_client.jar`, `amps_client-javadoc.jar` and `amps_client-sources.jar` into the Tomcat `lib` folder.

The pre-compiled JAR files are in the `api\client\java\dist\lib\` directory, which contains the JAR files mentioned above.

All of the above-mentioned java dependency files can be found after downloading and installing the AMPS Java Evolution Kit.

If a user has Linux machine available, install the AMPS distribution. Otherwise, download the AMPS Evolution Virtual Machine.

NOTE

To effectively use the `.jar` files, unblock these files by right-clicking on the File and selecting **Properties**. On the **General** tab, click **Unblock**.

- Elasticsearch connectors

Dependencies for each supported Elasticsearch version are included in Panopticon Real Time installation:

- `Elastic_6X_Dependencies.zip`
- `Elastic_7X_Dependencies.zip`

Select the target Elasticsearch version and unzip the contents of the appropriate dependency zip into the Tomcat `lib` folder.

□ JMX

Use the following java options to enable JMX monitoring for the JMX plugin:

Enable JMX remote connection: (-Dcom.sun.management.jmxremote)

Disable JMX authentication: (-Dcom.sun.management.jmxremote.authenticate=false)

Set remote port for jmx: (-Dcom.sun.management.jmxremote.port=number)

NOTE

Providing invalid parameters into JMX connection string may cause a number of exceptions and make the server inaccessible. Make sure you are using the syntax provided above.

□ OneMarketData OneTick / OneTick CEP

This connector requires that the following JAR be added:

```
jomd.jar
```

Which is retrieved from the OneTick bin folder:

For example:

```
C:\omd\one_market_data\one_tick\bin
```

Additionally, the following environment variables **MUST** be configured:

PATH

To include the OneTick bin folder.

For example:

```
C:\omd\one_market_data\one_tick\bin
```

ONE_TICK_CONFIG

To reference the OneTick configuration file.

For example:

```
C:\omd\client_data\config\one_tick_config.txt
```

Plus, the Tomcat configuration should include the following Java option:

```
-Djava.library.path=C:\omd\one_market_data\one_tick\bin
```

The OneTick configuration file should have entries for Windows OS time zone mapping and information.

Example:

```
WINDOWS_TZ_MAPPING_FILE="C:/OMD/one_market_data/one_tick/config/windows_tz_mapping.dat"
```

```
WINDOWS_ZONEINFO_PATH="C:/OMD/one_market_data/one_tick/config/zoneinfo"
```

Additionally, the OneTick client folder should be set to have the same permissions as those running the Tomcat process. Please check that the OneTick Java API is operational, before accessing workbooks through the server that utilize OneTick connectivity. This can be easily achieved by running one of the OneTick Java API examples.

NOTE

- The OneTick JAR must be updated to match the version of the OneTick client installation.
- For version 16.7.0, the OneTick connector is built and tested against version 1.17 of the OneTick Client.

□ SAP Sybase ESP

Manually copy the following dependency files from the Sybase ESP installation folder (e.g., C:\Sybase\ESP-5_1\libj) :

- commons-codec-1.3.jar
- log4j-1.2.16.jar
- streaming-client.jar
- streaming-system.jar
- ws-commons-util-1.0.2.jar
- xmlrpc-client-3.1.3.jar
- xmlrpc-common-3.1.3.jar

NOTE

Make sure the dependency files are copied to the appropriate WEB-INF folder in Apache Tomcat:

- For 64-bit: C:\Program Files\Apache Software Foundation\Tomcat 9.0\webapps\panopticon\WEB-INF\lib
- For 32-bit: C:\Program Files (x86)\Apache Software Foundation\Tomcat 9.0\webapps\panopticon\WEB-INF\lib

□ StreamBase CEP

This connector requires the following JAR to be added:

`sbclient.jar`

Which is retrieved from the StreamBase Lib folder.

For example: C:\TIBCO\sb-cep\7.5\lib

□ StreamBase LiveView

This connector requires the following JAR files to be added:

- `sbclient.jar`, `lv-client.jar`, `lv-client-wwwdeps.jar`

Which are retrieved from the StreamBase Lib folder.

For example: C:\TIBCO\sb-cep\7.5\lib

Plus, the JARS from the LiveView installation:

- `lv-compiler.jar, jyaml-1.3.jar`

Which are retrieved from the `LiveView Lib` folder.

For example: `C:\TIBCO\sb-cep\7.5\liveview\lib`

DATABASE

There are two ways of connecting to a database from Altair Panopticon Real Time.

- Use the Listed Data Connector for the specific Database (if available).

Includes: Cassandra, Elasticsearch 6.x, Elasticsearch 7.x, InfluxDB, Kx kdb+, ksqldb, LivySpark, MongoDB, OneTick, OneTick Cloud, Panopticon Data Extract, Splunk.

- Use the JDBC connector.

This requires:

- Addition of the JDBC JAR(s) for the required Database into `Tomcat/Lib`.
- For [JNDI](#):

Update of the server configuration file: `panopticon.xml` to include the new JNDI resource name.

JNDI Name (JNDI resource name as defined inside Context eg. `jdbc/MyDB`)

- For URL: Use the [URL](#) specific to the database's JDBC driver, the [Driver Class Name](#) specific to the driver, and the *Username* and *Password*.

URL

Driver Class Name

User Id

Password Show characters

JDBC Driver Installation

Install the relevant JDBC driver(s) on the system where you are running Tomcat and Panopticon Real Time. The exact installation procedure depends on the JDBC driver. Follow the instructions given by the provider of the JDBC driver and by the provider of your Java application server (for example, Apache Tomcat). In almost every case, a JDBC driver is installed by placing one or several jar-files in the `lib` folder of your Tomcat installation.

JNDI Connection Details

JNDI Connection details are specified in Panopticon Real Time configuration file `panopticon.xml`.

Each connection has the following structure:

```
<Resource name="jdbc/[Unique Name]"
  auth="Container"
```

```

type="javax.sql.DataSource"
maxActive="100"
maxIdle="30"
maxWait="10000"
username="[User Name]"
password="[Password]"
driverClassName="[Class Name]"
url="[URL]"
/>

```

Where:

- Unique Name:** Defines the unique JNDI resource name to be used.
- User Name:** The username to authenticate to the database.
- Password:** The password to authenticate to the database.
- Class Name:** The Class Name specific to the Database's JDBC Driver.
- URL:** The URL specific to the Database's JDBC Driver, and selected Server instance and database.

Additionally, other key attributes of the JNDI resource are:

- maxActive:** The maximum number of active connections that can be allocated from this pool.
- maxIdle:** The maximum number of connections that will be kept active even when there are no requests.
- maxWait:** Maximum time in milliseconds to wait for a database connection to become available.

Common Databases and their JNDI Configurations

Database	Description
Oracle 11	Using ojdbc6.jar <ul style="list-style-type: none"> • driverClassName="oracle.jdbc.OracleDriver" • url="jdbc:oracle:thin:@[HostName]:1521:[DatabaseName]"/>
MS SQL Server	Using sqljdbc4.jar <ul style="list-style-type: none"> • driverClassName="com.microsoft.sqlserver.jdbc.SQLServerDriver" • url="jdbc:sqlserver://[Server]\[Instance];databaseName=[DatabaseName]"/>
Sybase ASE	Using jconn4.jar <ul style="list-style-type: none"> • driverClassName="com.sybase.jdbc4.jdbc.SybDriver" • url="jdbc:sybase:Tds:[HostName]:5000/[DatabaseName]"
PostgreSQL	Using postgresql-9.4.1208.jar <ul style="list-style-type: none"> • driverClassName="org.postgresql.Driver" • url="jdbc:postgresql://[HostName]:5432/[DatabaseName]"
MySQL	Using mysql-connector-java-5.1.38-bin.jar <ul style="list-style-type: none"> • driverClassName="com.mysql.jdbc.Driver" • url="jdbc:mysql://[HostName]:3306/[DatabaseName]"/>

R AND PYTHON TRANSFORM SUPPORT

R and Python connectivity and transforms occur over TCP/IP network links.

- For R, Rserve is used.
- For Python, Pyro (Python Remote Data Objects) is used.

R Integration

To enable R connectivity:

1. Download R, install it, and the R Console (<http://cran.rstudio.com/>).
2. Open the R Console.
3. Install Rserve using the following command from within the R Console:

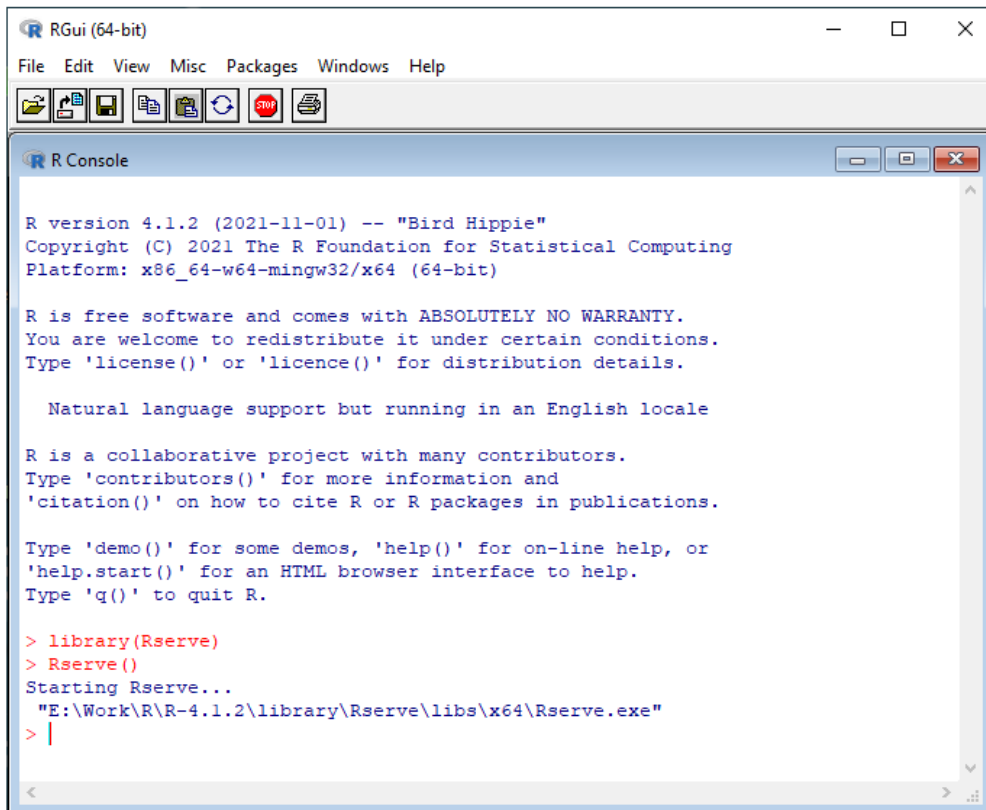

```
install.packages("Rserve")
```
4. Initiate the Rserve library using the following command:

```
library(Rserve)
```
5. Run Rserve by executing the following command:

```
Rserve()
```

Only steps 2, 4 & 5 need to be repeated when R connectivity is required.

Example:

```
RGui (64-bit)
File Edit View Misc Packages Windows Help
[Icons]

R Console
R version 4.1.2 (2021-11-01) -- "Bird Hippie"
Copyright (C) 2021 The R Foundation for Statistical Computing
Platform: x86_64-w64-mingw32/x64 (64-bit)

R is free software and comes with ABSOLUTELY NO WARRANTY.
You are welcome to redistribute it under certain conditions.
Type 'license()' or 'licence()' for distribution details.

Natural language support but running in an English locale

R is a collaborative project with many contributors.
Type 'contributors()' for more information and
'citation()' on how to cite R or R packages in publications.

Type 'demo()' for some demos, 'help()' for on-line help, or
'help.start()' for an HTML browser interface to help.
Type 'q()' to quit R.

> library(Rserve)
> Rserve()
Starting Rserve...
"E:\Work\R\R-4.1.2\library\Rserve\libs\x64\Rserve.exe"
> |
```

NOTE Connectivity by default is over Port 6311.

To enable authentication across the Rserve TCP/IP link

- ❑ create a password file (pwdfile.pwd)

Each line of the file should have the user and then the password.

Example:

```
user1 password1
user2 password2
```

- ❑ Create a configuration file with following parameters (rconfig.conf)

```
auth required
pwdfile [path of password file]
```

Example:

```
remote enable
auth required
port 6311
pwdfile C:\\RIntegration\\pwdfile.pwd
```

- ❑ load the created configuration file (the default Rserve configuration file is still loaded, but its settings have lower priority) and run Rserve:

```
Rserve(args="--RS-conf [path of configuration file]")
```

Example:

```
Rserve(args="--RS-conf C:\\RIntegration\\rconfig.conf")
```

Python Integration

Panopticon can use Python for both data transforms and as a primary data source. The server part of Panopticon will send requests to Python, with data and/or Python code, via Pyro4 - Python Remote Objects. Pyro4 installs as a Python package in your Python environment, and connectivity is enabled by starting a Pyro process with a shell script file (.BAT script file) which is included in the Panopticon distribution zip-archive.

To set up a Python environment that can be used from Panopticon, follow these steps:

1. [Download and install Python.](#)
2. [Install Pyro4.](#)
3. [Install pandas.](#)
4. [Install additional packages.](#)
5. [Set the Pyro HMAC key.](#)
6. [Start Pyro4.](#)

Downloading and Installing Python

Download Python from <https://www.python.org/downloads/> and select the release version you require as well as the right version for the operating system of your server. Note that Linux systems often have Python included out of the box. Install Python as described by documentation from Python.org. You can install Python on the same host that runs the Panopticon server, or a different host, if firewall settings and port mapping allow communication between the two hosts. If you are running Panopticon for development, testing or personal use on your workstation, install Python on your workstation as well.

Installing Pyro4

When Python is installed, add Pyro4 by installing it like a Python package. The Pyro4 version must be 4.71 or higher. On the command prompt, type **python** and press **Enter** to start a Python prompt. Then run this command:

```
pip install Pyro4>=4.71
```

Installing Pandas

When working with a data table in Python, the pandas package and the pandas DataFrame object provides many useful advantages and is highly recommended. Panopticon's integration with Pyro4 will check if the object returned from Python is a pandas DataFrame and therefore the pandas package is required. On the Python prompt, run this command:

```
pip install pandas>=1.1.5
```

This will also automatically give you the NumPy package.

Installing Additional Packages

To be able to view and use the examples in the Panopticon example workbook "How to Python", you are also required to install a few additional packages using these commands:

```
pip install scikit-learn>=1.0.1
```

```
pip install pyarrow>=3.0.0
```

Setting the Pyro HMAC Key

When you send a request to Pyro4, you are required to supply the correct password which is called the Pyro HMAC Key. This password protects the Python environment from unauthorized remote calls via Pyro4. You should create an environment variable named **PYRO_HMAC_KEY** on the host where Python and Pyro4 are installed. However, if **PYRO_HMAC_KEY** is not found or created, the environment variable will be created by the script used for [starting Pyro4](#). The default value is **password**. You have the option of either:

- creating the **PYRO_HMAC_KEY** and setting a password value of your choice
- editing the start script and entering your password value instead of the default value **password**

When using Python from Panopticon, either as a transform or as a primary data source, you will supply the password as part of the connection settings in Panopticon. The password can also be saved in the [Panopticon.properties](#) file, by an Administrator, which will let Designer users create Python connections without knowledge of the password.

Starting Pyro4

Before you can use Python from Panopticon, you must start the Pyro4 process that will receive requests from Panopticon and pass them on to Python. This is done by running a script included with Panopticon on the host where Python and Pyro4 are installed.

On Linux, you run the file **start_Python_connectivity.sh** which in turn runs the file **pyro.py**.

On Windows, you run the file **start_Python_connectivity.bat** which in turn runs the file **pyro.py**.

Multiple Python Environments on Windows

On Windows, you can install multiple Python versions in parallel, resulting in installation folders like the following examples:

- ❑ C:\Program Files\Python38
- ❑ C:\Program Files\Python39
- ❑ C:\Program Files\Python310

Each of these versions has their own package installations. For example, you can have one version of a package installed for Python 3.9 and another package version for Python 3.10.

NOTE

When installing packages for different versions of Python on a host which will serve multiple users, make sure you install from a command prompt with elevated privileges (run As Administrator), otherwise, packages will be installed under your own Windows user profile folder.

With Python for Windows downloaded from Python.org, you also get **py.exe** which is a Python launcher. When installing Python for all users, it is placed in C:\Windows\py.exe or C:\Users\\AppData\Local\Programs\Python.

With the Python launcher **py.exe**, you can start a specific Python version as follows:

```
py -3.9
```

To make a package installation for a specific Python version, open a command prompt as Administrator and run:

```
py -3.9 -m pip install <packagename>
```

To start a Pyro4 process with a specific Python version (in this example, 3.9) you can launch Pyro4 as follows:

```
start_Python_connectivity.bat -3.9
```

LOAD CUSTOM DATA PLUGINS

Panopticon Real Time will load a file named **Plugins.xml** during startup. The file contains class names of all the data plugins that will be loaded and applied to the server. However, the `Plugins.xml` file can be replaced in case the user wants to have a custom setup and load their own plugins or if they want to disable certain data plugins from being loaded. This is achieved by creating a new `plugins.xml` file and placing it in the `AppData` folder (e.g., `c:\vizserverdata`).

The original `plugins.xml` file is always distributed with the `panopticon.war` file. From the `.war` file, copy the `plugins.xml` file from the root folder to your `AppData` (i.e., `c:\vizserverdata`) folder. Then open `plugins.xml` and add or remove items to either enable or disable certain plugins.

NOTE

New data plugins are constantly being developed and distributed. Therefore, it is recommended that you revisit the shipped `plugins.xml` file after each release if you have replaced the default `plugins.xml` file.

[9] VIEWING AND MANAGING WORKBOOKS

ACCESSING WORKBOOKS

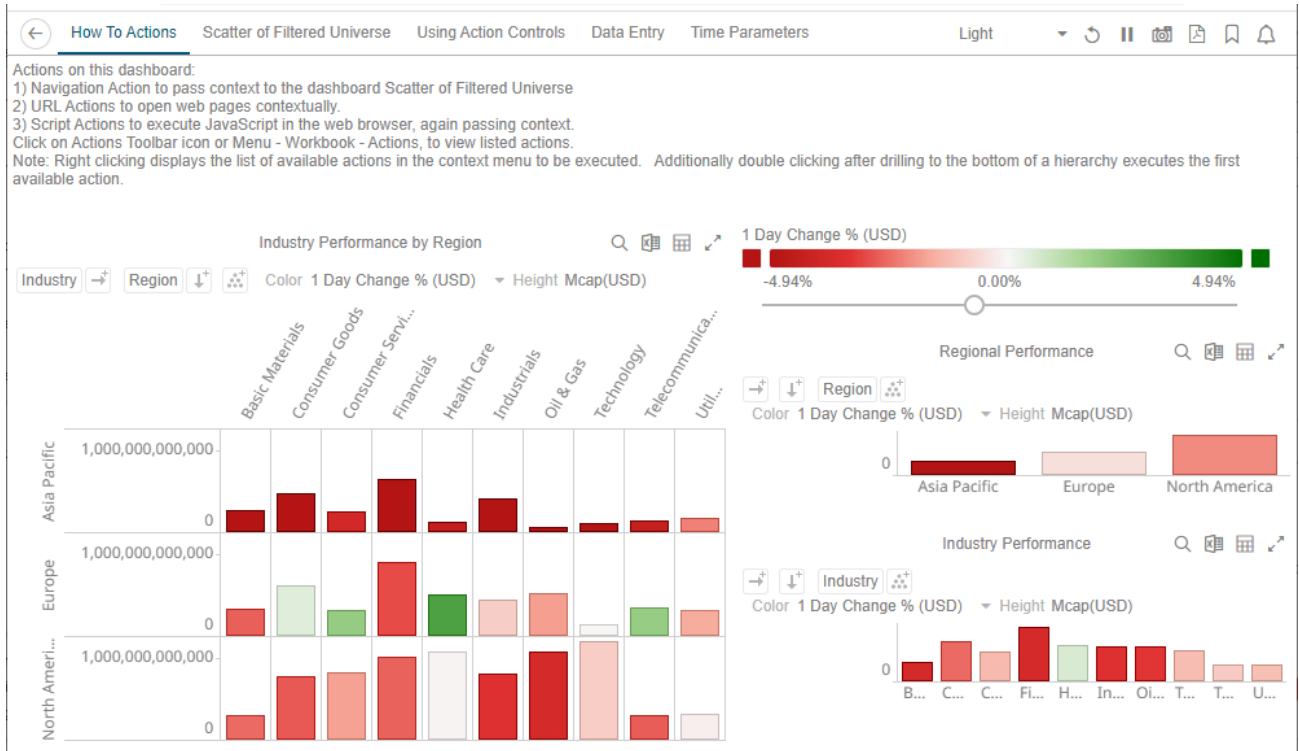

The **Workbooks** tab lists available folders and uploaded or published workbooks in *Grid View*.

- ❑ The **Folders** include their names and the number of available workbooks.
- ❑ The **Workbooks** include their titles, thumbnail images, and when they were last modified.

Recently opened workbooks are also displayed under the *Quick Access* pane.

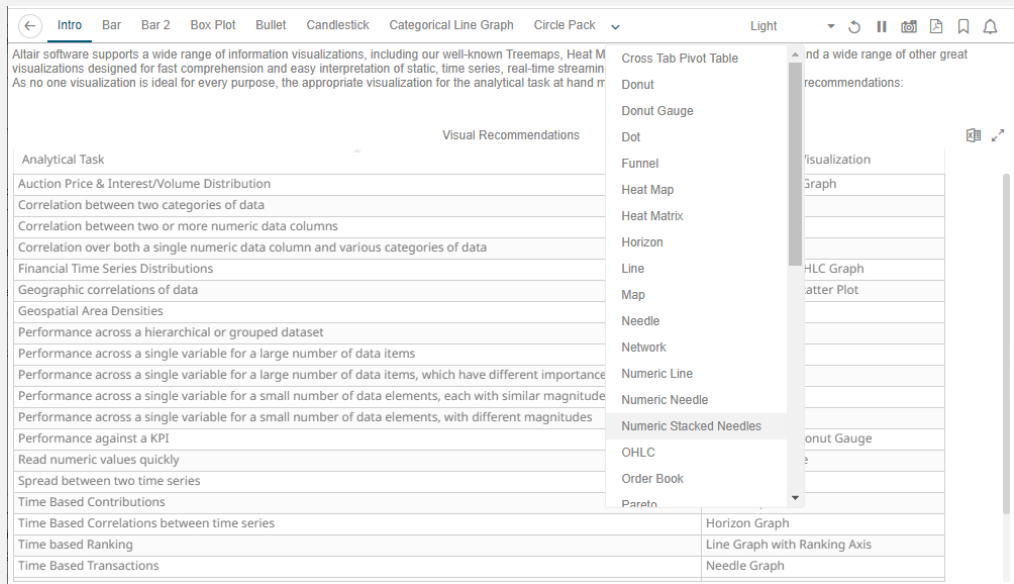

The screenshot displays the Altair Panopticon interface with the 'Workbooks' tab selected. The top navigation bar includes 'Altair Panopticon', 'Workbooks', 'Data Library', 'Webhooks', 'Alerts', 'Parameters', 'Themes', and 'System'. On the left, the 'Organization' sidebar shows 'OrderBook' and 'Users' with a user '-designer'. A search bar labeled 'Search Workbook' is positioned above the main content area. The main area is divided into sections: 'Quick Access' (top) showing three thumbnails for 'How to Drill', 'Order Book', and 'How to Actions'; 'Folders' (middle) showing a folder named 'OrderBook' with '0 workbooks'; and 'Workbooks' (bottom) showing a grid of thumbnails for 'How to Actions' and 'How to Drill', each with a 'Modified a day ago' timestamp. The thumbnails feature various data visualizations like heatmaps and bar charts.

Clicking on the workbook thumbnail opens it on the web browser.

NOTE

The  signifies there are more dashboards in a workbook that can be opened. Click this icon to expand the drop-down list and display all of the available dashboards and select one to display.

NOTE

The **Back**  button allows going back to the root folder. It is only available on the toolbar section of the *Open Workbook in View Mode* if `startURL` is available in the `workbook.json` file located in `<appdata>/JavaScriptConfiguration/`.

```
{
  "baseUrl" : "..",
  "forceClientSelectionHandling" : true,
  "startUrl" : "../",
  "subscriptionCompression" : true,
  "dataLoading" : {
    "transport" : "websocket"
  },
  "webGleEnabled" : true,
  "pdfMultiplePagesEnabled" : true
}
```

However, for the **Back** button to use the browser history to navigate back despite `startUrl` being set in the file, add `useBrowserHistoryToNavigateBack` and set to `true`.

```
{
  "baseUrl" : "..",
  "forceClientSelectionHandling" : true,
  "startUrl" : "../",
  "useBrowserHistoryToNavigateBack" : true,
  "subscriptionCompression" : true,
  "dataLoading" : {
    "transport" : "websocket"
  },
  "webGleEnabled" : true,
  "pdfMultiplePagesEnabled" : true
}
```

After updating the `workbook.json` file, restart the Panopticon application.

Searching for Workbooks

Search for particular workbooks that may be located in different folders and perform other operations like merge, copy, download, or remove.

Steps:

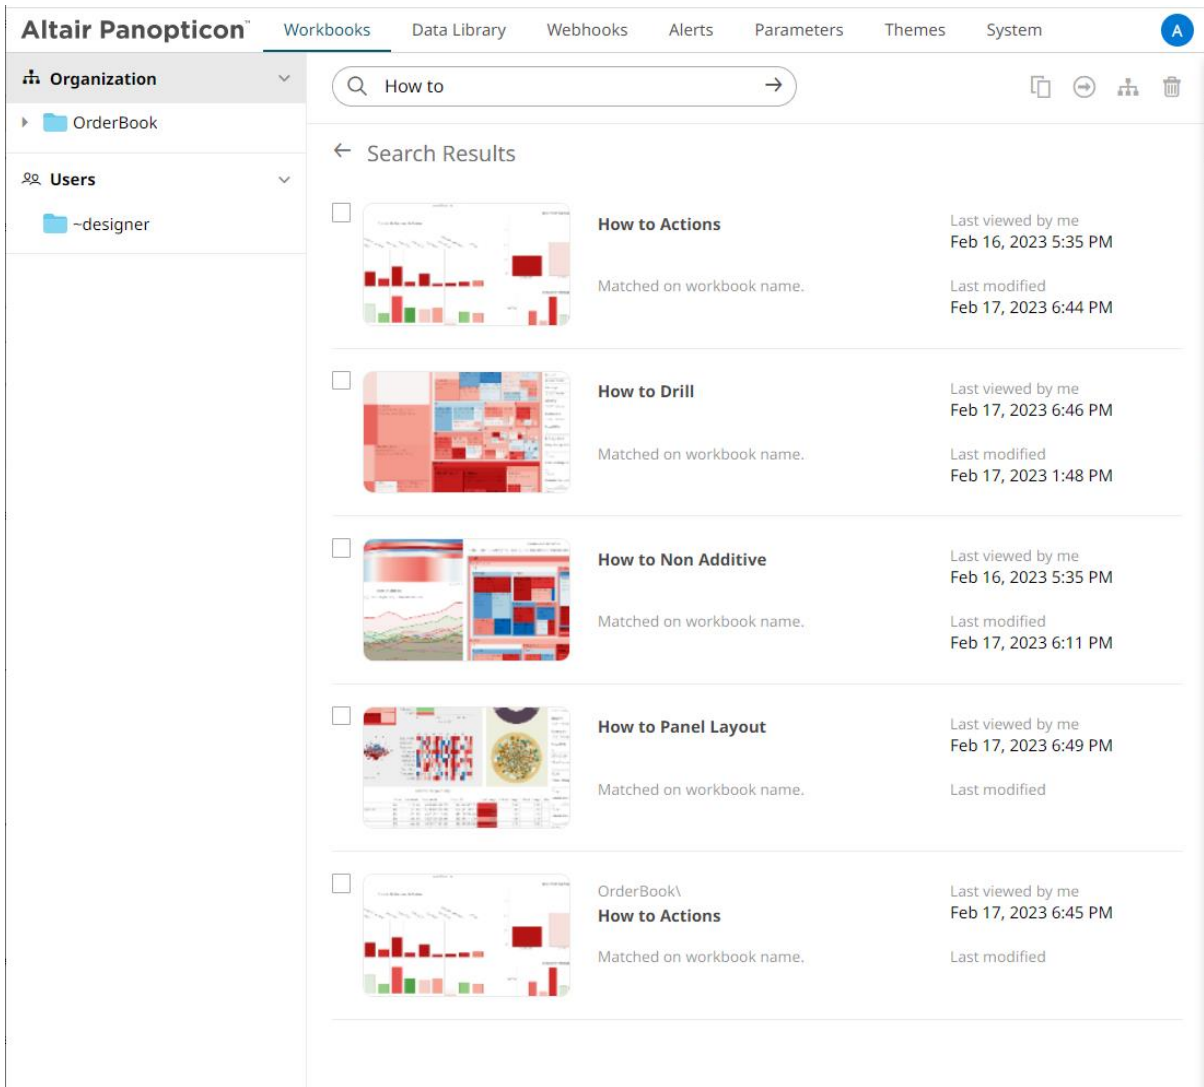

1. On the *Workbooks and Folders Summary* layout, click on a workbook folder then enter a workbook name or dashboard name in the *Search Workbook* box.
2. Click .

The following information are displayed for each workbook:

- Folder where the workbook is located
- What the search match was based on: workbook or dashboard name
- Date/Time when the workbook was last viewed
- Date/Time when the workbook was last modified

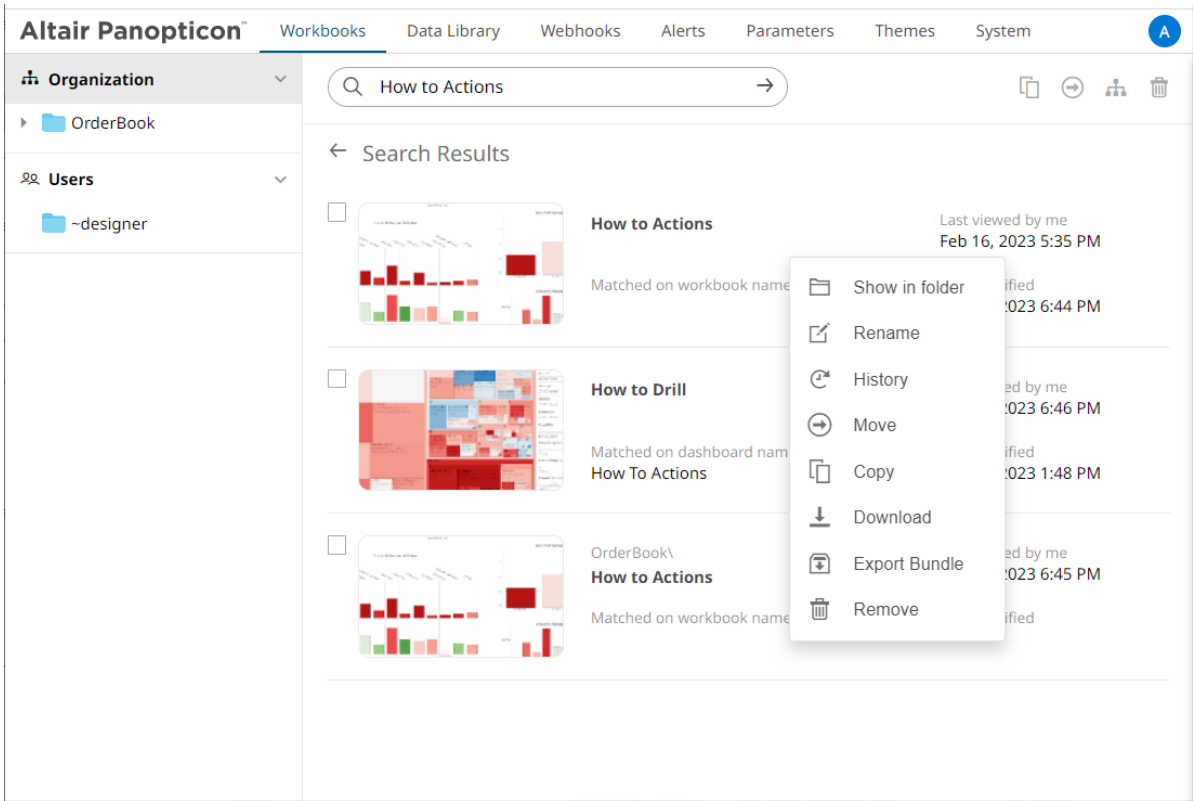

You can also enter one or more characters into the *Search Workbook* box then click **Enter**. The list of workbooks that matched the entries will be displayed.

Click on a workbook thumbnail to open and display it on the web browser.

To go back to the *Workbooks and Folders Summary* layout, click  .

You may opt to right-click on a workbook or select several workbooks to display the context menu.

To display the workbook in its location, click **Show in Folder** on the context menu.

The other context menu options are discussed in the sections below.

Folders and Workbooks Display View

Workbooks can be displayed either on a *List* or *Grid View*.

On the *Toolbar*, click **List View** , the folders and workbooks are displayed in a standard listing.

Altair Panopticon™ Workbooks Data Library Webhooks Alerts Parameters Themes System A

Viewed an hour ago

OrderBook

<input type="checkbox"/>	Name ↑	Last viewed by me	Last published
<input type="checkbox"/>	 How to Actions	Feb 17, 2023 6:44 PM	Feb 16, 2023 5:35 PM
<input type="checkbox"/>	 How to Drill	Feb 17, 2023 1:48 PM	Feb 17, 2023 6:46 PM
<input type="checkbox"/>	 How to Non Additive	Feb 17, 2023 6:11 PM	Feb 16, 2023 5:35 PM
<input type="checkbox"/>	 How to Panel Layout		Feb 17, 2023 6:49 PM

Or click **Grid View**  . The folders and workbooks are displayed as thumbnails.

On either display view style, clicking on a workbook title or thumbnail displays the workbook on the *Open Workbook in View Mode*. For more information on how to analyze interactive dashboards, refer to the [Client User Guide](#).

Sorting Workbooks

Sorting workbooks can be done by *Name*, *Last Viewed/Last Published*, or *Last Viewed by Me*.

Steps:

On the *Folders and Workbooks Summary* layout, either:

- click the **Sort By** option on the *Toolbar* of the *Grid View*

By default, the sorting is by **Name**.

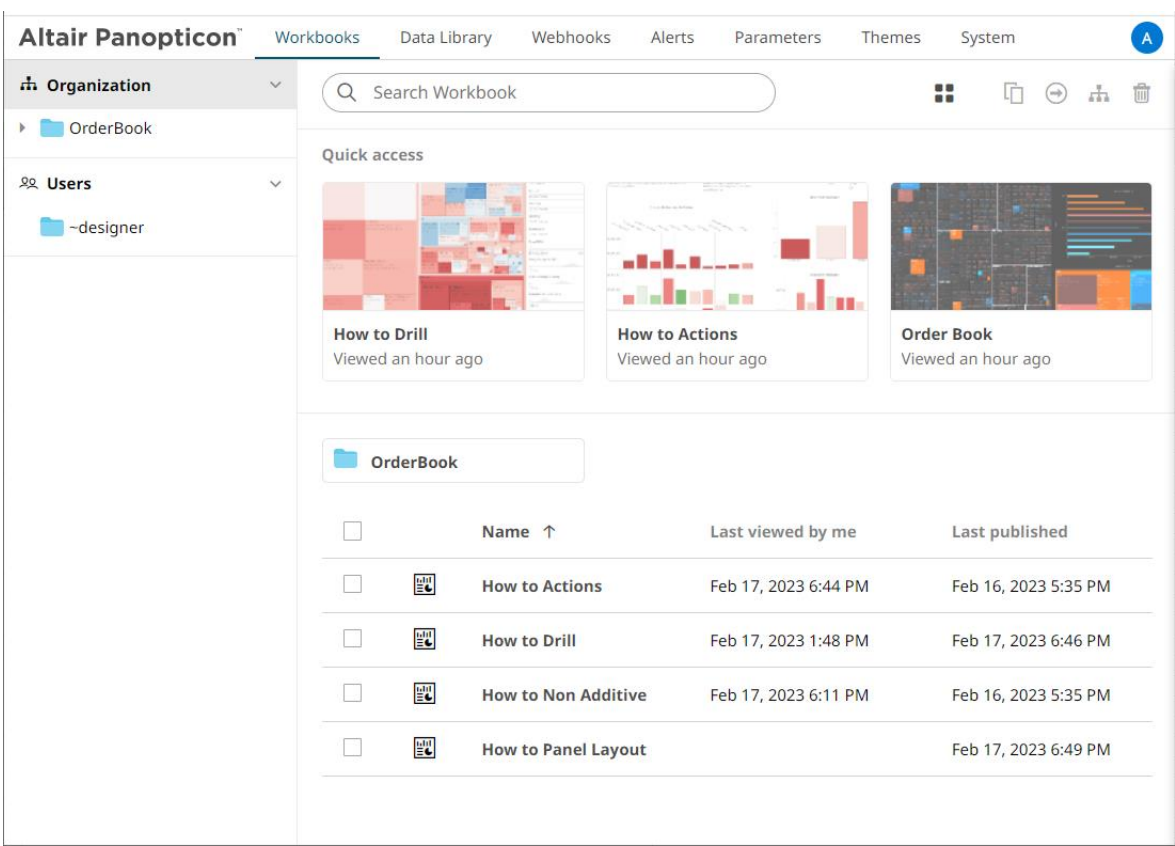

- Name
- Last Modified
- Last Viewed By Me

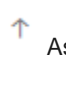

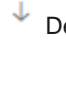

Then click the *Sort Order*:

-  Ascending
-  Descending

☐ click on the **Name**, **Last Viewed By Me**, or **Last Published** column header of the *List View*

Then click the *Sort Order*:

-  Ascending
-  Descending

Creating Workbooks

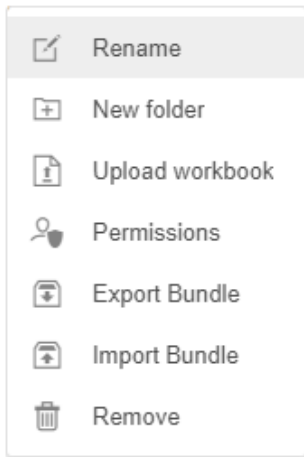

A user with a Designer role can create workbooks using the web authoring tool in Panopticon Real Time. This feature is extensively discussed in the [Panopticon Web Authoring Guide](#).

Renaming Workbooks or Folders

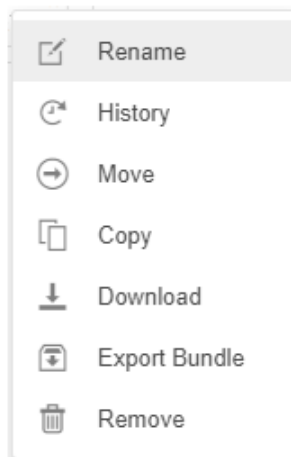

A user with an Administrator or Designer role can rename workbooks and folders.

Steps:

1. Right-click on a workbook or folder then select **Rename** on the context menu.

Workbook Folder or Subfolder Context Menu

Workbook Context Menu

The *Rename Workbook* or *Rename Folder* dialog displays.

2. Enter a new name then click

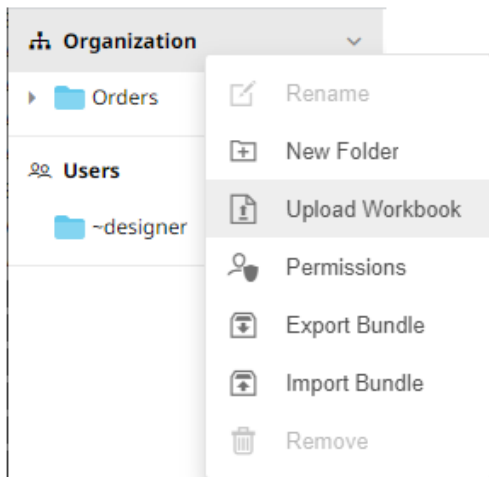

Uploading Workbooks

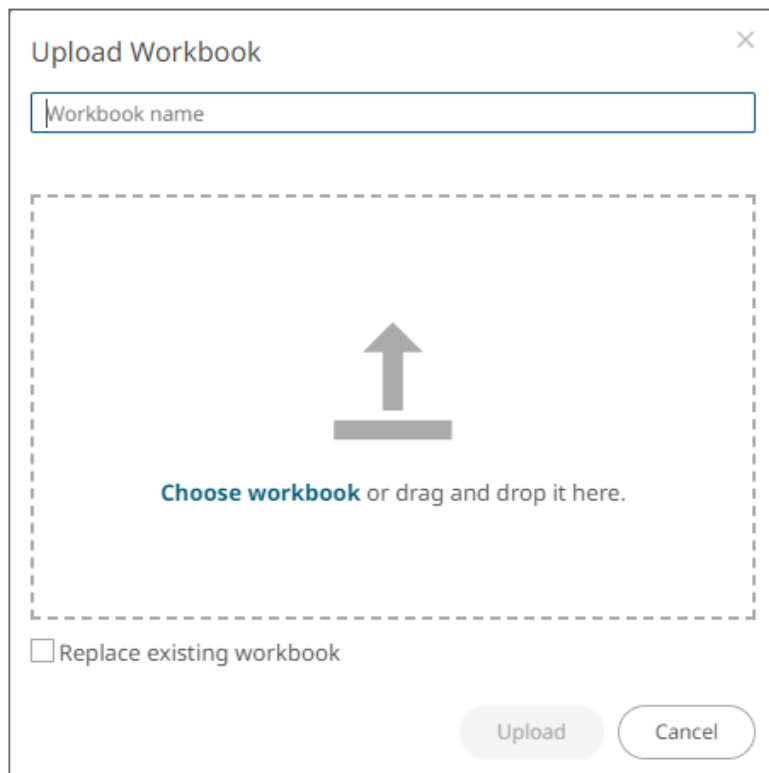

Users with an Administrator role can upload workbooks to the currently selected folder in the *Workbooks* page.

Steps:

1. On the *Workbooks* page, click on a folder or a personal folder and select **Upload Workbook**.

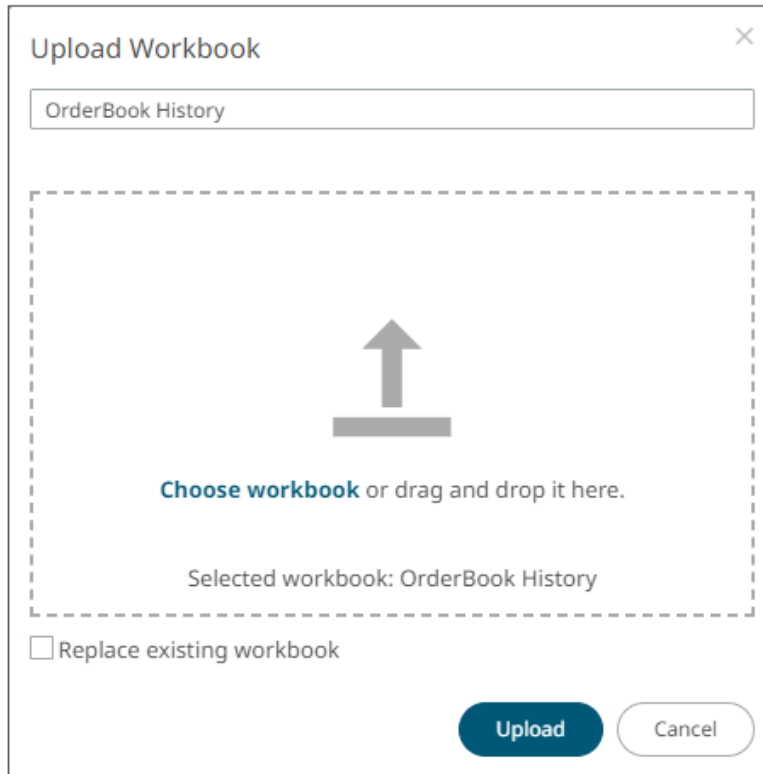

The *Upload Workbook* dialog displays.

2. To upload a workbook, you can either:
 - drag it from your desktop and drop on the dialog, or
 - click **Choose Workbook** and select one on the *Open* dialog that displays.

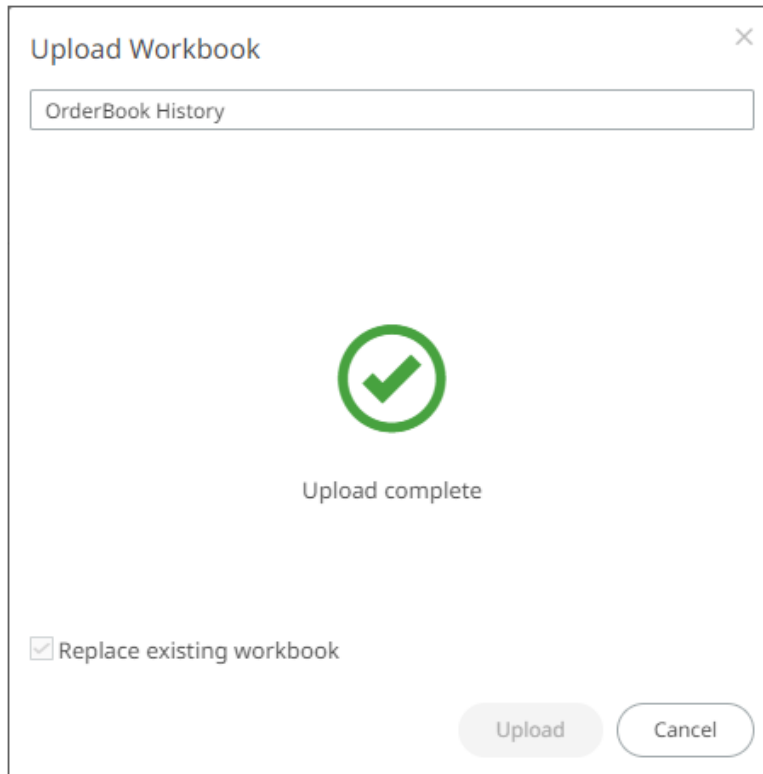

The name of the workbook is displayed on the uploaded workbook area and in the *Name* box.

3. You can opt to rename the workbook.
4. To replace an existing workbook, check the **Replace existing workbook** box.

5. Click  .

You will be notified once the workbook is uploaded.

The workbook is added and displayed.

NOTE

- An error message is displayed if the data source schema of the uploaded workbook has not been updated or missing.
- The uploaded workbook will not include the data source. However, if Panopticon Real Time can reach the same folder of the data source, or the workbook has been designed in the same machine, then the data can be viewed.

Viewing Workbook History and Republishing

Aside from opening workbooks, a user with either an Administrator or Designer role can also perform the following:

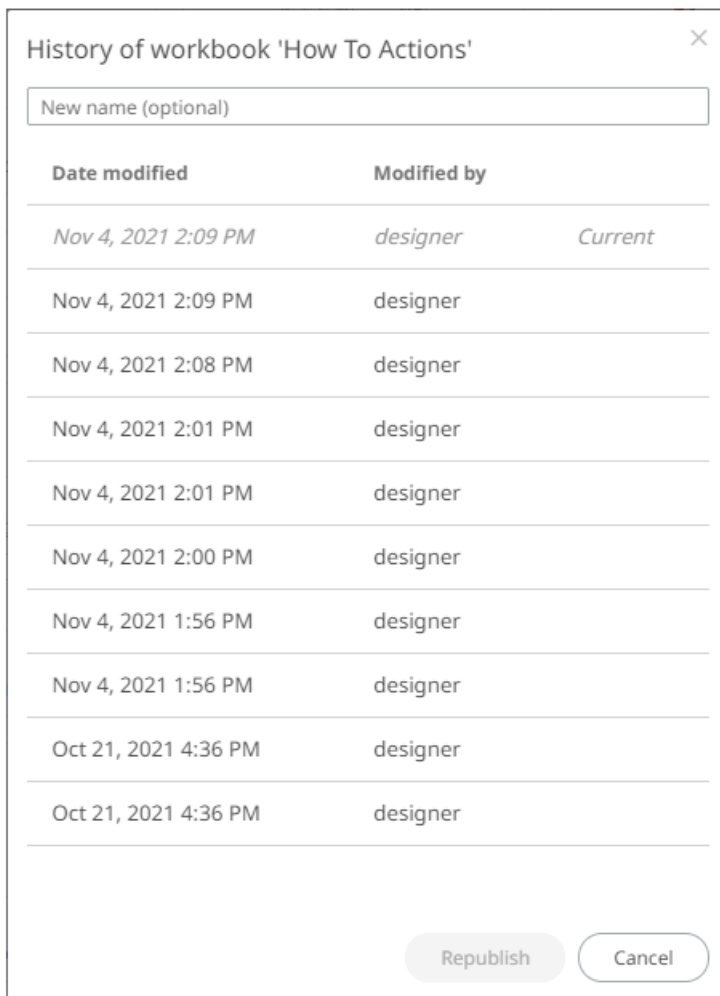

- View the change history of workbooks
- Republish an archived workbook to the recent version of Panopticon Real Time
- Rename an archived workbook

Steps:

1. On the **Workbooks** tab, right-click on a workbook and select **History** on the context menu.

The *History of Workbook <Name>* dialog is displayed with the current version of the workbook indicated.

Sort the archival list either through the *Date Modified* or *Modified By* by clicking on the  or  button.

Also, move to the other pages of the list by clicking on a page or clicking the  or  button.

2. You may opt to rename an archived workbook by entering a new one in the *New Name* box.
3. Click on an archived workbook in the list.

History of workbook 'How To Actions' ✕

Date modified	Modified by	
Nov 4, 2021 2:09 PM	designer	Current
Nov 4, 2021 2:09 PM	designer	
Nov 4, 2021 2:08 PM	designer	
Nov 4, 2021 2:01 PM	designer	
Nov 4, 2021 2:01 PM	designer	
Nov 4, 2021 2:00 PM	designer	
Nov 4, 2021 1:56 PM	designer	
Nov 4, 2021 1:56 PM	designer	
Oct 21, 2021 4:36 PM	designer	
Oct 21, 2021 4:36 PM	designer	

Then click . A notification message displays.

Are you sure you want to republish the earlier version of 'How To Actions'?

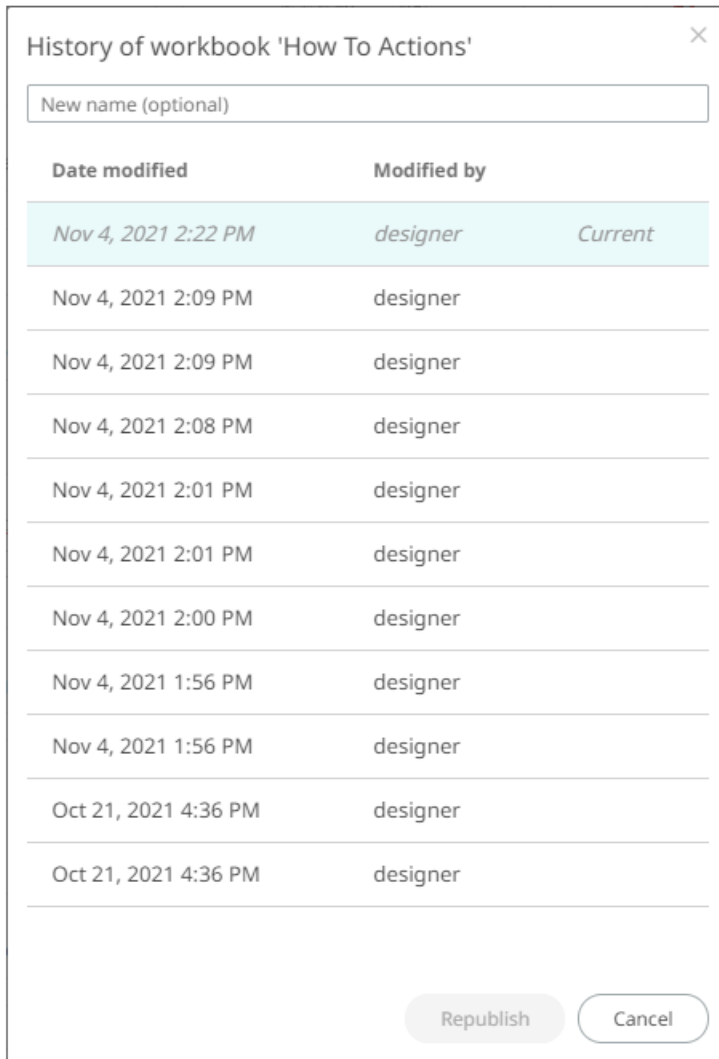

4. Click .

A confirmation message displays.

5. Click  .

The republished workbook version is added in the history list.

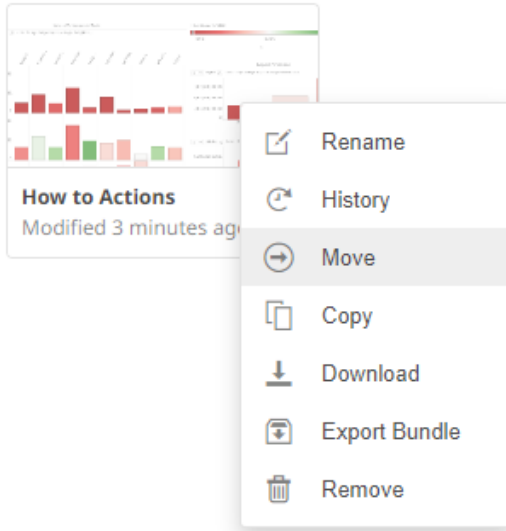

Moving Workbooks

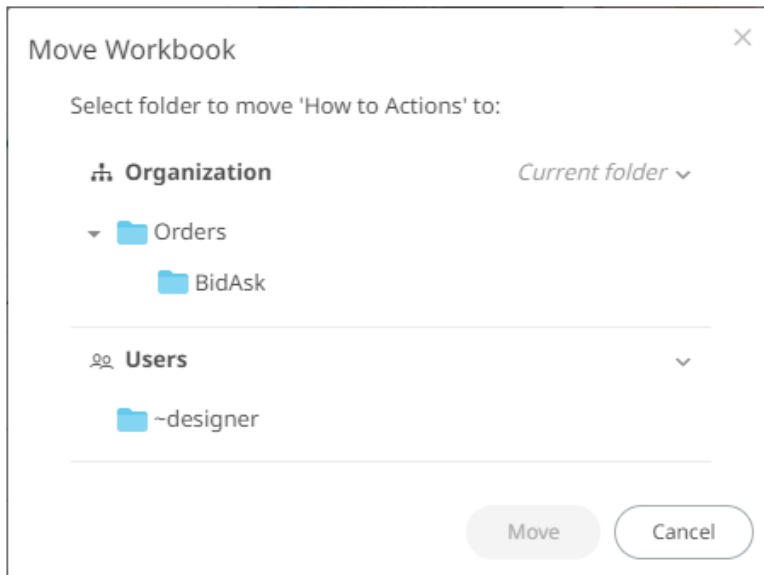

Users with Administrator or Designer role are allowed to move a workbook to another folder or subfolder they have permission to.

Steps:

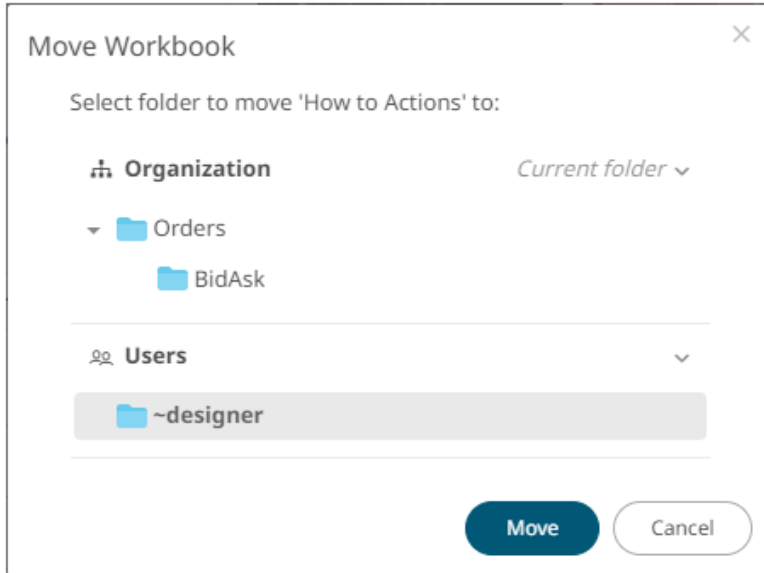

1. Right-click on a workbook and select **Move** on the context menu.

The *Move Workbook* dialog displays with the folder or subfolders the user is allowed to move the workbook.

2. Select the folder or subfolder.

3. Click  .
The workbook is moved and displayed on the selected folder.

Copying Workbooks

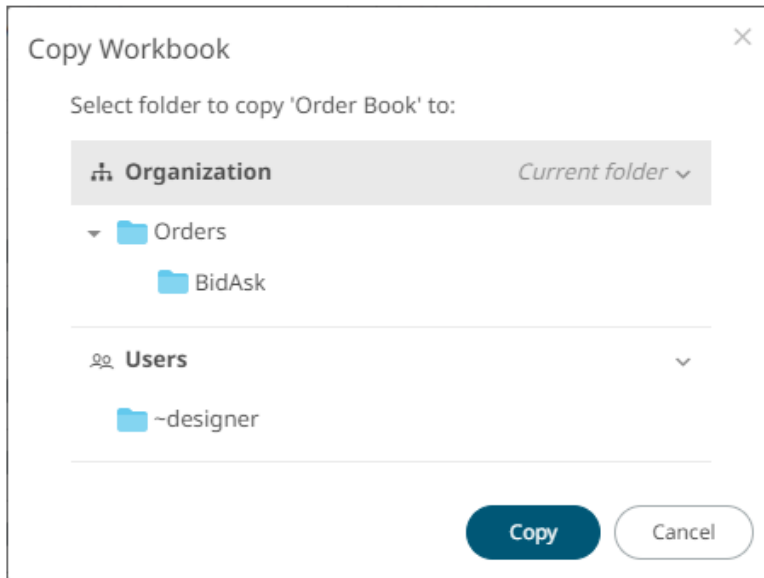

Users with Administrator or Designer role are allowed to copy a workbook to another folder or subfolder they have permission to.

Steps:

1. Right-click on a workbook and select **Copy** on the context menu.

The *Copy Workbook* dialog displays with the folder or subfolders the user is allowed to copy the workbook to.

2. Select the folder or subfolder.

3. Click  .

The workbook is copied and displayed on the selected folder.

PARAMETER VALUE PASSING INTO THE WEB CLIENT

The Web client uses JSON URL query string to pass parameters.

For example:

```
/params/{"param1":"value1","param2":"value2"}
```

Again, parameter values must be URL encoded:

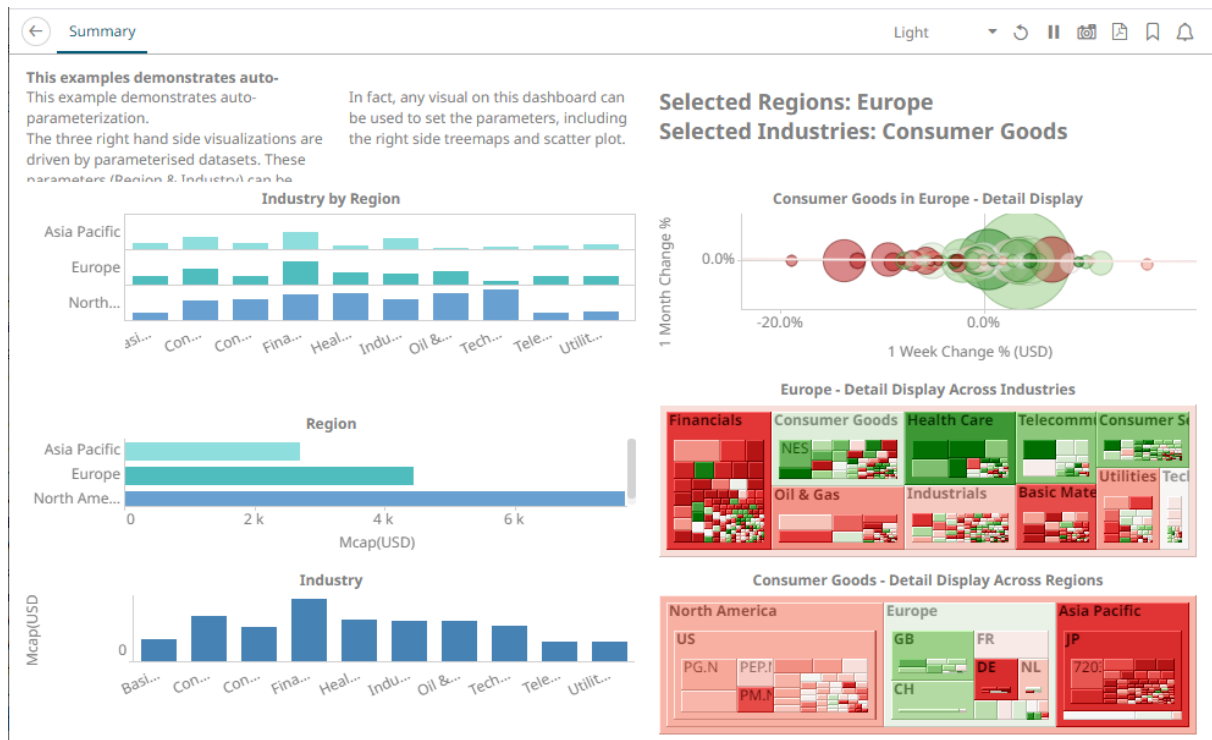

```
http://[host:port]/panopticon/workbook/#/[workbook_name]/[dashboard_name]/params/{"param1":"value1","param2":"value2"}
```

Where:

- Parameters are passed in JSON format
- Every parameter's name should be enclosed in double quotes (i.e., "")
- /params/ sub-path should be placed in prior to JSON sections with parameters
- Special symbols in the parameter values should be URL-encoded. (Refer to [Special Symbols to Pass Parameter Values into the HTML5 Client](#) for more information.)

Here is an example URL with parameters that displays one of the example workbooks:

```
http://localhost:8080/panopticon/workbook/#/How%20to%20Auto%20Parameterize/Summary/params/%7B%22Region%22:%22Europe%22,%22Industry%22:%22Consumer%20Goods%22%7D
```

This workbook can also be displayed on the web browser using this URL:

```
http://localhost:8080/panopticon/workbook/#/How to Auto  
Parameterize/Summary/params/{"Region":"Europe","Industry":"Consumer Goods"}
```

To filter specific values, the array of values can be passed again in a standard JSON format, enclosing the array elements into square brackets:

```
{"Region":["Europe","North America"]}
```

For example:

```
http://localhost:8080/panopticon/workbook/#/How to Auto  
Parameterize/Summary/params/{"Region":["Europe","North  
America"],"Industry":"Consumer Goods"}
```

Special Symbols to Pass Parameter Values Into the HTML5 Client

When trying to pass parameters to the new HTML5 Client, you need to use URL-encoded characters.

For example, for `{"Type": [Soft/Drinks"]}` to work, it should be changed to `{"Type": [Soft%252FDrinks"]}`

Here is a list of double-encoded values you can use to replace their corresponding character.

Character	Double Encode Value
"<"	"%253C"
"/"	"%252F"
">"	"%253E"

[10] DATA LIBRARY

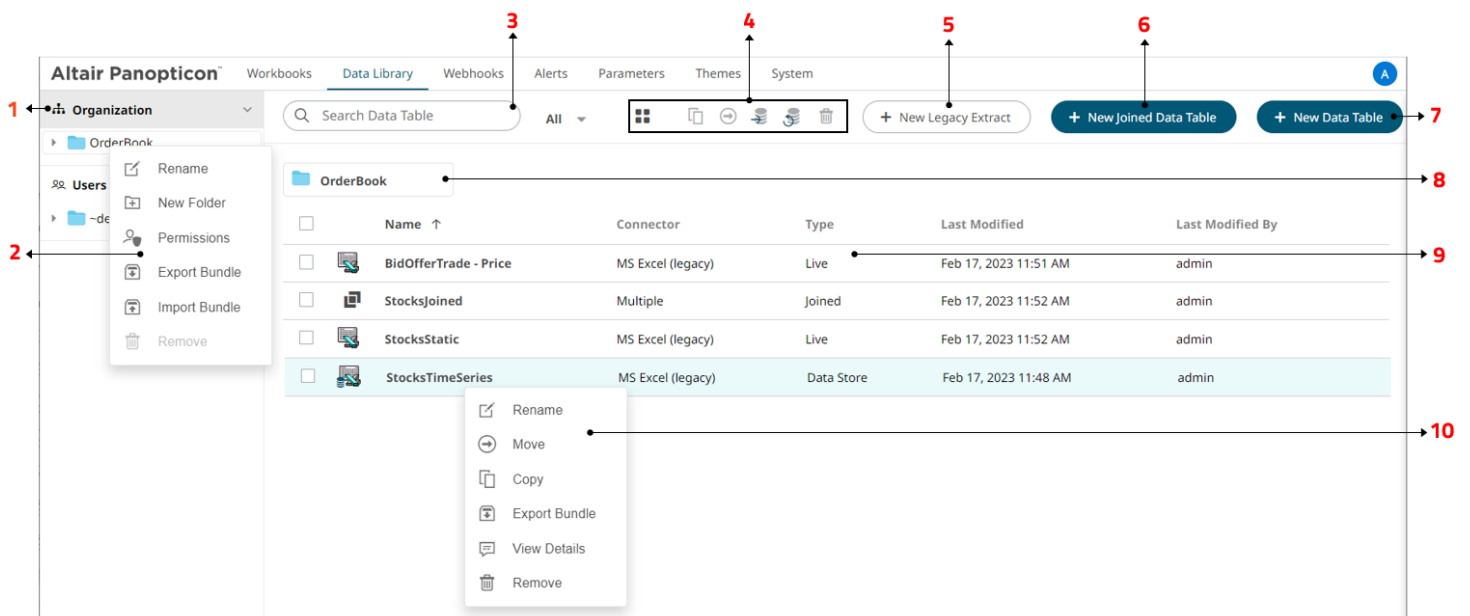

The *Data Library* page allows creation and management of reusable data tables outside workbooks. Data tables from the data library can be used by multiple workbooks server wide.

Some important concepts to remember:

- ❑ Bringing data inside workbooks is done through data tables.
- ❑ A data table contains metadata for data source connection settings, data query, schema definition, calculated columns, transforms, etc.
- ❑ One data table can use only one data connector to connect to a data source.
- ❑ Two or more data tables can be joined to create a new joined data table.
- ❑ Data table permissioning and sharing between users or groups is done similarly like workbooks (i.e., using folder tree).
- ❑ There are four types of data tables. The first three resides at the Data Library, the fourth one, called **linked data tables**, will be part of workbooks and will reference one of the three types from Data Library.

Data Table Type	Description
Data Store	Users can opt to store data closer to Panopticon server in an embedded database.
Live	Direct connection to source data.
Joined	Two or more different types of data tables joined together creating a new data table.
Linked	Resides inside workbooks and points to one of the data tables from Data Library.

The *Data Library* page is composed of the following sections.

Data Library Page Sections and Descriptions

Section	Description
1	<p>Folders</p> <p>List of folders where data tables can be saved, exported, or imported.</p>
2	<p>Folder Context Menu</p> <p>Allows you to:</p> <ul style="list-style-type: none"> • Create a data table and joined data table • Assign folder permissions on your workspace • Import or export data table bundles • Create, rename, or remove folders
3	<p>Search Data Table</p> <p>Entering text will filter data tables which can include:</p> <ul style="list-style-type: none"> • Those that are available in data store • Live data tables • Joined data tables • Extracts
4	<p>Toolbar</p> <p>Allows you to:</p> <ul style="list-style-type: none"> • Display the data tables list either on List View or Grid View • Copy or move data tables to other folders • Import data table to data store • Clear and import data table to data store • Delete data tables
5	<p>New Legacy Extract</p> <p>Allows accessing data by retrieving only the required results into memory, by querying on demand, pushing aggregation, and filtering tasks to underlying big data repositories, or queryable data extracts.</p>
6	<p>New Joined Data Table</p> <p>Allows you to join data tables created in the data library.</p>
7	<p>New Data Table</p> <p>Allows you to create a data table.</p>
8	<p>Folders List</p> <p>Available folders.</p>
9	<p>List of Data Tables and Data Extracts</p> <p>Data tables and data extracts created in the data library.</p>
10	<p>Data Table Context Menu</p> <p>Allows you to:</p> <ul style="list-style-type: none"> • Export data table bundles • Copy or move data tables to other folders • Rename or remove data tables

	<ul style="list-style-type: none"> View details of the data table

For more information on using this page, see [\[4\] The Data Library Page](#) section in the [Web Authoring Guide](#).

SETTING UP DATA STORE

To be able to use data store, you would need to set the following properties. By default, Panopticon supports MonetDB, so default values correspond to it.

Also, MonetDB JDBC driver is packaged with Panopticon server. For other data store types, refer to [JDBC Driver Installation](#) section.

Property	Data Store
Attribute	<code>datastore.connection.schema</code>
Description	Name of the database schema to be used for creating or managing objects inside database.
Default Value	dbo
Property	Data Store
Attribute	<code>datastore.type</code>
Description	Controls which data store connector should be used. Valid values are MonetDB , MSSQLServer and PostgreSQL .
Default Value	MonetDB
Property	Data Store
Attribute	<code>datastore.connection.jndi</code>
Description	JNDI resource name for the connection e.g., jdbc/MyDB . More details on how to configure JNDI is at JNDI Connection Details section.
Default Value	
Property	Data Store
Attribute	<code>datastore.connection.url</code>
Description	JDBC connection URL for the database e.g., jdbc:monetdb://localhost:49153/PanopticonDataStore This property value is discarded if <code>datastore.connection.jndiproperty</code> is set.
Default Value	
Property	Data Store
Attribute	<code>datastore.connection.driverclassname</code>
Description	Fully qualified Java class name of the JDBC driver used for the connection.

Default Value	<code>org.monetdb.jdbc.MonetDriver</code>
Property	Data Store
Attribute	<code>datastore.connection.username</code>
Description	Username for the connection. Only required when using connection URL.
Default Value	
Property	Data Store
Attribute	<code>datastore.connection.password</code>
Description	Password for the connection. Only required when using connection URL.
Default Value	

CACHING

Panopticon Real Time supports five levels of caching:

- Data Store
- Real-time subscription cache
- Data source cache
- Data table cache
- Query result cache

All of which are optional. If caching is specifically not desired, data requests can always be forwarded to the underlying data repository.

The subscription cache describes the cache used for streaming subscriptions. This cache is used to ensure subscriptions are not duplicated by the server, and that instead the server manages duplicate end client subscription requests. Subscriptions are started when the server receives a valid client request and can be set to stop when users are no longer watching data from them or be kept alive until the server is stopped.

The data caches simply keep corresponding data sources and tables in memory to avoid unnecessary reloads from the underlying data repositories. Neither is used for real-time data, but the data source cache helps with real-time data is joined to standing data. The cache entries are keyed on:

- The workbook
- The data table
- The data source
- Parameter values

The time-to-live (TTL) for entries is based on the auto refresh period set on the data table.

The query result cache stores the result of a query from an individual visualization, filter, or legend on a dashboard. It is useful if many users are viewing the same dashboard, when many identical queries will be sent in parallel to the server. It also caches real-time data for this purpose.

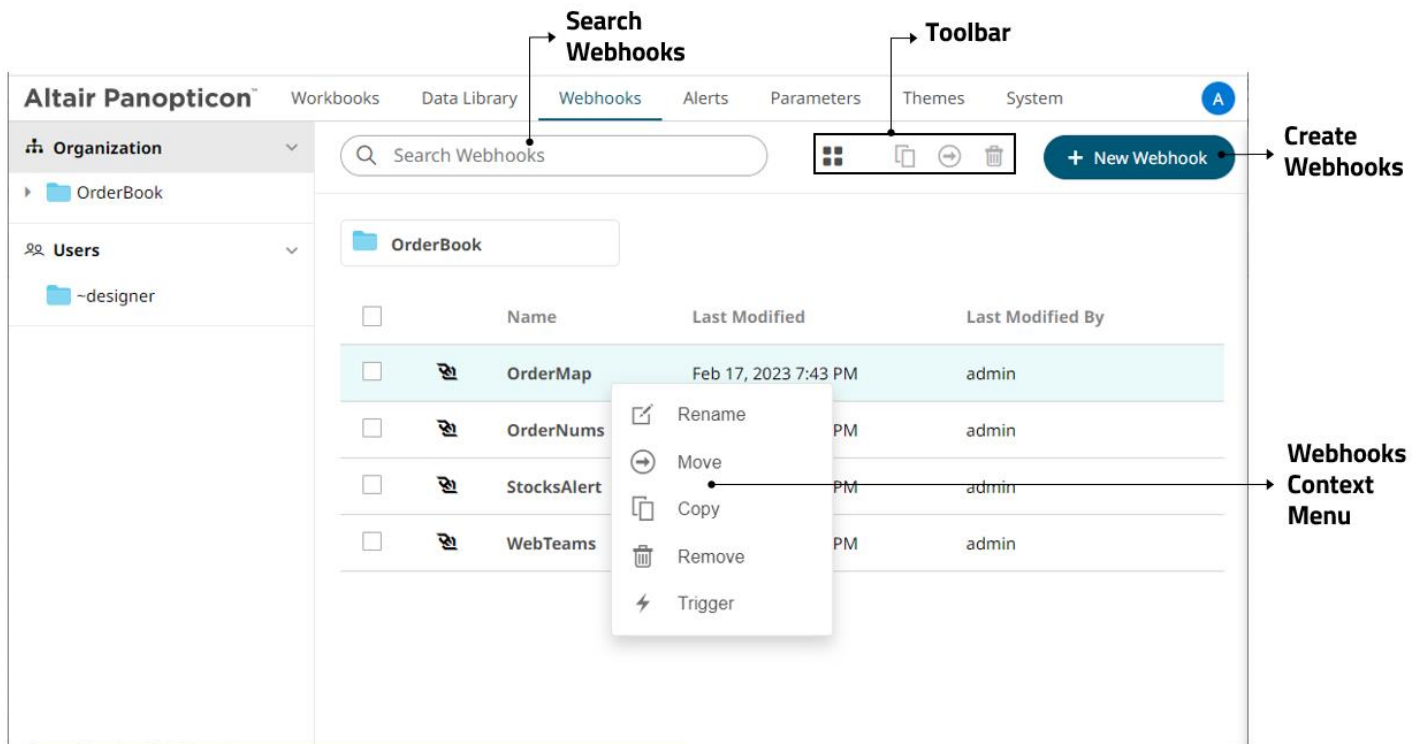

[11] WEBHOOKS

A webhook is a special URL that makes it possible to send a message from other systems into the system that issued the webhook. Webhook URLs should be treated with care and not shared publicly, since anyone with knowledge about the webhook URL will be able to use it.

Collaboration platforms such as Microsoft Teams, Slack and many others all have support for creating incoming webhooks. In Panopticon, outgoing webhooks can be added (based on incoming webhook URLs from other systems) and used as a channel for sending messages about triggered alerts, like how such messages can also be sent by email. Webhooks added to Panopticon are stored in the server folder structure and are subject to the same permissions model as workbooks.

An outgoing webhook in Panopticon can be used as the message channel for multiple different alerts in multiple different workbooks, due to the parameterization of the webhook request body. The exact structure and content that you should create in the request body of a webhook will be specified in the documentation of the system that issued the webhook.

NOTE Do not expect that the example [request body](#) shown below, will work as is.

Property	Description
Search Webhooks	Entering text will filter the webhooks.
Toolbar	Allows copying, moving, and removing of webhooks. Also, to display the webhooks list either on List View or Grid View .

Create Webhooks	Allows creating new webhooks.
Webhooks Context Menu	Allows renaming , moving , copying , deleting , and enabling of the trigger of webhooks.

Folders and Webhooks Display View

Webhooks can be displayed either on a *List* or *Grid View*.

On the *Toolbar*, click **Grid View** . The folders and webhooks are displayed as thumbnails.

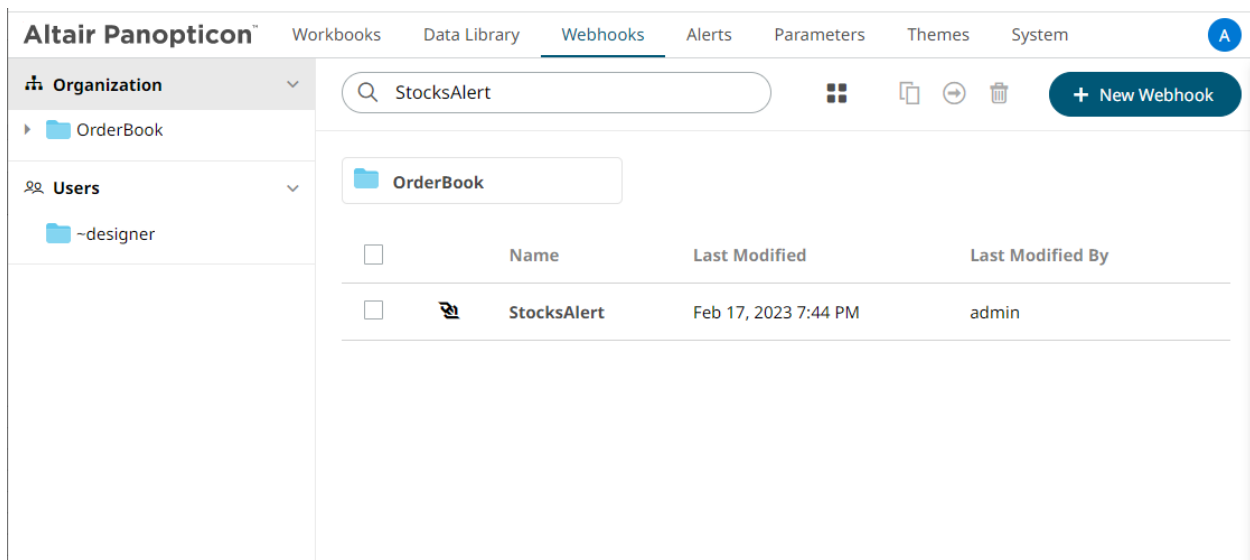

Or click **List View** , the folders and webhooks are displayed in a standard listing.

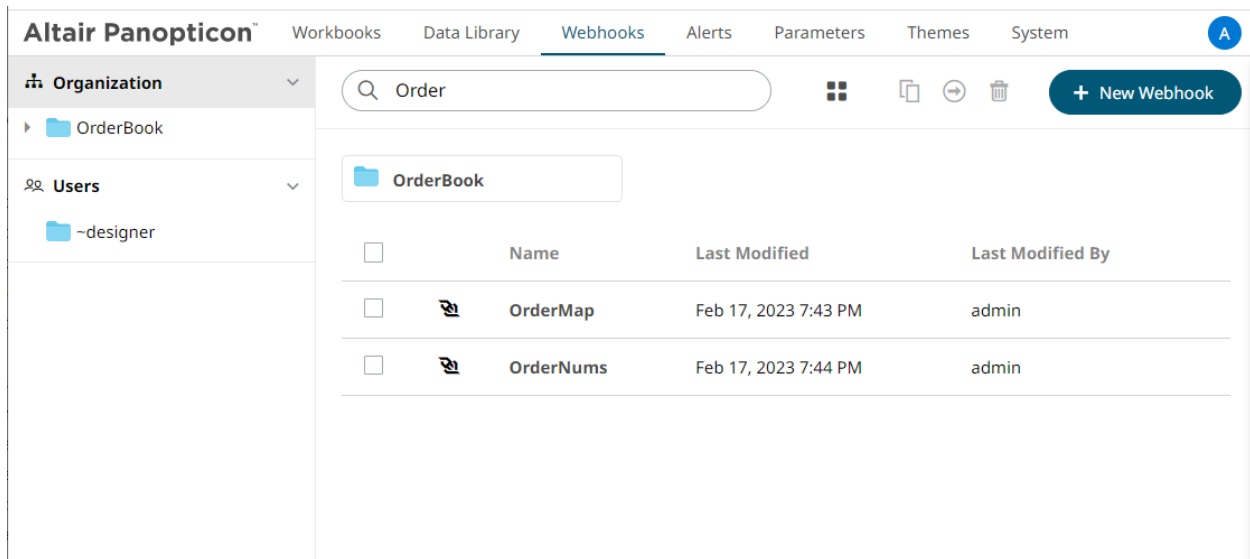

On either display view style, clicking on a webhooks title or thumbnail displays the *Webhooks* page.

Searching for Webhooks

On the *Webhooks* tab, to search for a particular webhook, enter it in the *Search Webhooks* box.

You can also enter one or more characters into the *Search Webhooks* box then click **Enter**. The suggested list of webhooks that matched the entries will be displayed.

Click on a webhooks to open and display.

To clear the filter, delete the text entry in the *Search Webhooks* box.

CREATING WEBHOOKS

This section discusses the instructions and guidelines to create webhooks.

Steps:

1. On the **Webhooks** tab, click on a folder then

+ New Webhook

The *New Webhook* dialog displays.

2. Enter the name of the webhook then click

Create

The new webhook is displayed on the *Webhook* page.

Altair Panopticon™ Workbooks Data Library Webhooks Alerts Parameters Themes System A

← Webhook1 ⚡ Trigger 📄 Save

Description _____

Uri* _____

Headers _____

Http Method POST ▾

Timeout 10000

Content Type application/json

Request Body

3. Enter or select the following webhook properties:

Property	Description
Description	Description of the webhook.
URL	URL of the webhook. This property is required.
Headers	A comma separated list of name=value pairs representing HTTP headers.
HTTP Method	<p>Select the appropriate HTTP method for the request from the following options:</p> <div style="border: 1px solid gray; padding: 5px; margin: 5px 0;"> <div style="background-color: #00a6c9; color: white; padding: 2px;">GET ▾</div> <div style="background-color: #00a6c9; color: white; padding: 2px;">GET</div> <div style="padding: 2px;">POST</div> <div style="padding: 2px;">PUT</div> <div style="padding: 2px;">DELETE</div> </div> <ul style="list-style-type: none"> • GET – retrieve data • POST – add new data • PUT – replace existing data • DELETE – remove existing data
Timeout	Timeout (in ms) for reading a response from the URL.
Content Type	The content type of the request body. Default is application/json .

Request Body	<p>The request body to be supplied to the HTTP call.</p> <p>For example:</p> <pre> { 'Alert title': '{_alert_title}', 'Alert dashboard URL': '{_alert_dashboard_url}', 'Alert description': '{_alert_description}', 'Alert reason': '{_alert_reason}', 'Triggering items': '{_alert_triggering_items}', 'Timestamp': '{_current_time}', 'Folder': '{_workbook_folder}', 'Workbook': '{_workbook_name}', 'Dashboard': '{_dashboard_name}' } </pre>
--------------	---

NOTE

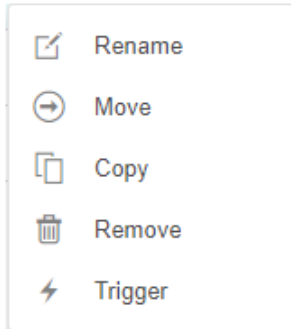

URL, Headers, and Request Body fields can be parameterized (i.e., special server parameters, alert parameters, and [global parameters](#)).

4. Click  to save the new webhook.
5. You may opt to click  to trigger the webhook. Any parameter in the request body will be replaced by its value when triggering the webhook request.
For example:
`{_current_time} - 2021-07-01T12:34:56Z`
6. Click  to go back to the *Folders and Webhooks* list. The new webhook is added on the list.

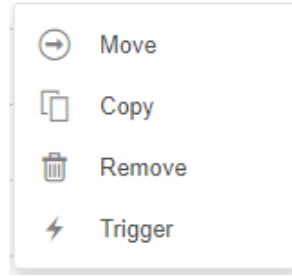

WEBHOOKS TOOLBAR AND CONTEXT MENU

Moving, copying, and removing webhooks can either be done using:

- Context menu

Webhook Context Menu

Webhooks Folder Context Menu

- Toolbar

List View

Grid View

The *Webhooks* toolbar options include:

Toolbar Option	Description
Sort By / Sort Order	Allows sorting webhooks by <i>Name</i> , <i>Last Modified</i> , or <i>Last Modified By</i> .
Display View	Display webhooks either by <i>List View</i> or <i>Grid View</i> .
Copy	Copy webhooks to another folder or subfolder where the user has permission.
Move	Move webhooks to another folder or subfolder where the user has permission.
Remove	Remove webhooks.

The *Context Menu* options include:

Toolbar Option	Description
Rename	Rename the webhook.
Move	Move webhooks to another folder or subfolder where the user has permission.
Copy	Copy webhooks to another folder or subfolder where the user has permission.
Remove	Remove webhooks.

[Trigger](#)

Trigger the webhook.

Sorting Webhooks

Sorting webhooks can be done by **Name**, **Last Modified**, or **Last Modified By**.

Steps:

On the *Webhooks* tab, either:

- ❑ click the **Sort By** option on the *Toolbar* of the *Grid View*.

By default, the sorting is by **Name**.

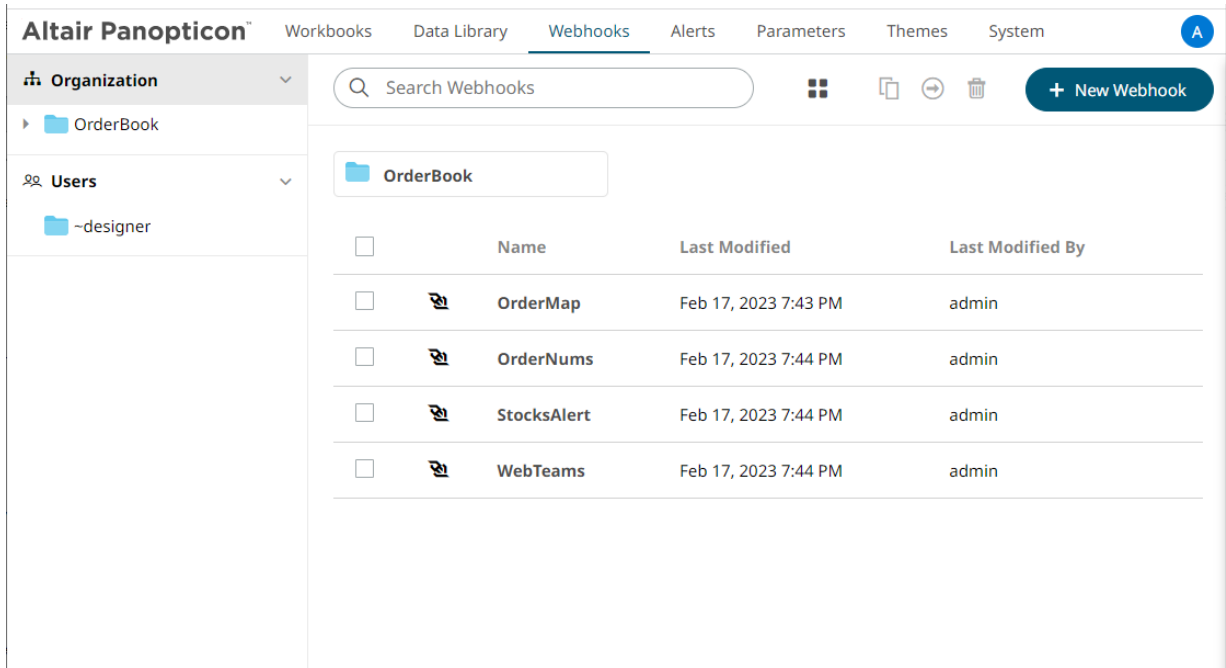

- Name
- Last Modified

Then click the *Sort Order*:

-  Ascending
-  Descending

- ❑ click on the **Name**, **Last Modified**, or **Last Modified By** column header of the *List View*.

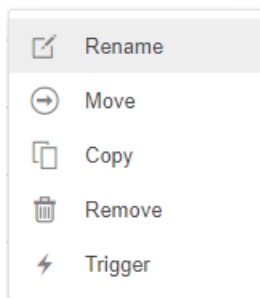

Then click the *Sort Order*:

- Ascending
- Descending

Renaming a Webhook

Steps:

1. Right-click on a webhook then select **Rename** on the context menu.

The *Rename Webhook* dialog displays.

2. Enter a new name then click

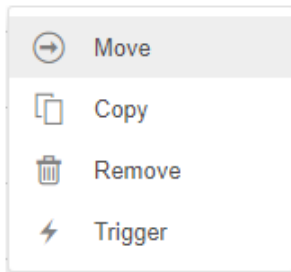

Moving Webhooks

Users with an Administrator role are allowed to move webhooks to another folder or subfolder where they have permission.

Steps:

1. Select the checkbox of one or several webhooks either on the *Grid View* or *List View*.
2. Then select either:

- **Move**  icon on the toolbar, or
- **Move** on the content menu.

The *Move Webhook* dialog displays with the folder or subfolders that the user is allowed to move the webhooks. Select the folder or subfolder.

3. Click  .
The webhooks are moved and displayed on the selected folder.

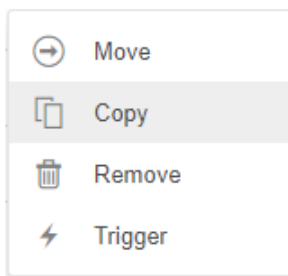

Copying Webhooks

Users with an Administrator role are allowed to copy webhooks to another folder or subfolder where they have permission.

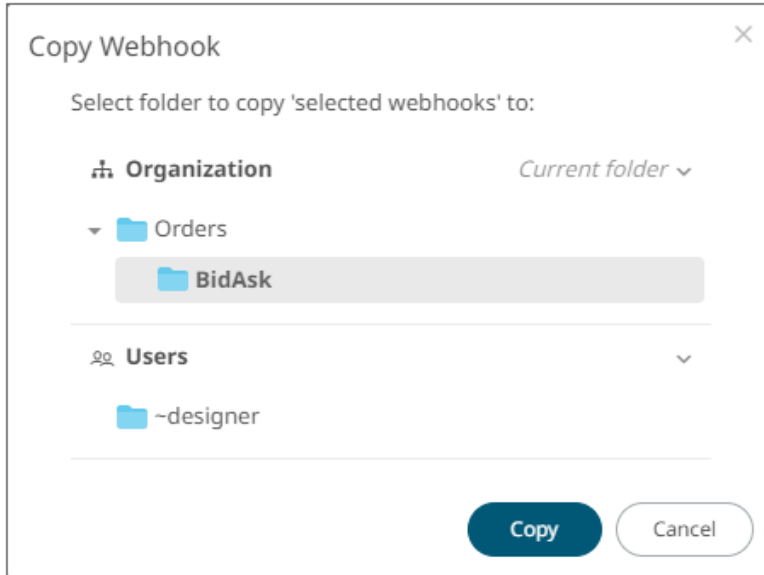

Steps:

1. Select the checkbox of one or several webhooks either on the *Grid View* or *List View*.
2. Then select either:

-  **Copy** icon on the toolbar, or
- **Copy** on the content menu.

The *Copy Webhook* dialog displays with the folder or subfolders the user is allowed to copy the webhooks to. Select the folder or subfolder.

3. Click  .

The webhooks are copied and displayed on the selected folder.

Deleting Webhooks

Users with an Administrator role can remove webhooks.

Steps:

1. Select the checkbox of one or several webhooks either on the *Grid View* or *List View*.
2. Then select either:
 - **Remove**  icon on the toolbar, or
 - **Remove** on the content menu.

A notification message displays.

3. Click  to remove.

Triggering Webhooks

To trigger a webhook, right-click on it and select **Trigger** on the context menu.

Any parameter in the request body will be replaced by its value when triggering the webhook request.

For example:

```
{_current_time} - 2021-07-01T12:34:56Z
```

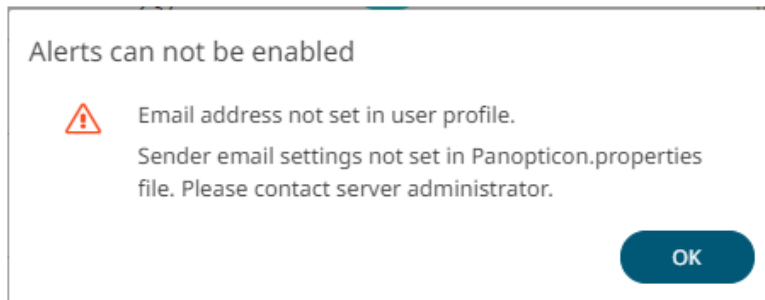

[12] ALERTING

The Alerts function allows a notification to be sent when the data in a visualization has met the predefined settings.

If alerts are required to be sent via email, Panopticon Real Time must be configured with valid email server information in the `Panopticon.properties` file located in the `AppData` folder (e.g., `c:\vizserverdata`).

See [Panopticon Real Time Configurations for Email Send Outs and Alerts](#) for instructions.

Otherwise, when trying to enable an alert, this error will be displayed:

In addition, you can also set the `alert.creation.only.by.administrators` property to **true** for only the Administrators to create alerts.

SETTING UP ALERTS

Alerts can be defined against:

- Streaming data sources (including CEP Engines and message queues)
- Periodically refreshed data sources (like Oracle, SAP Sybase, SQL Server, and so on)

Alert definition can be done by right-clicking on a streaming numeric or text data in a visualization in the Web Client and setting the limits, duration, what will be included, how many and when an email will be sent.

NOTE

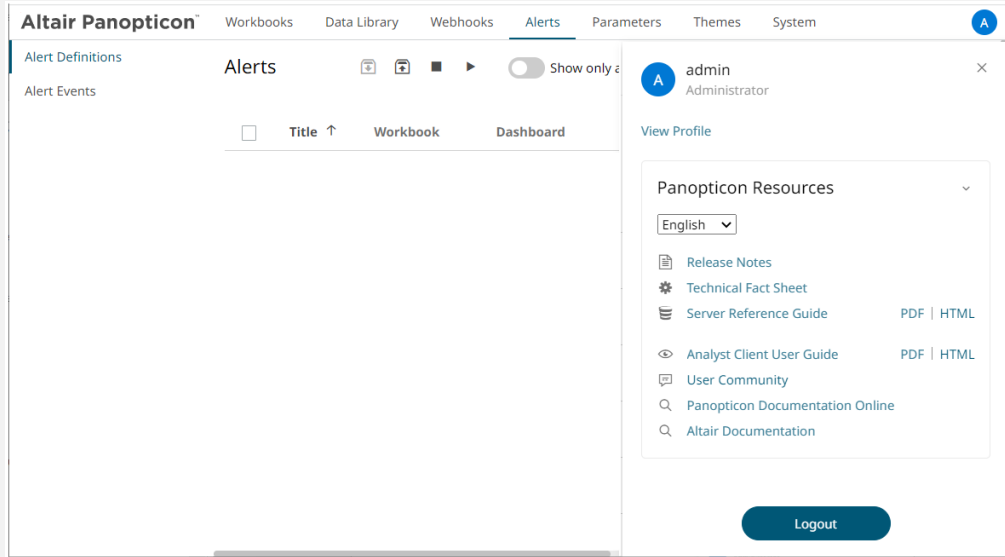

Before setting up the visualization alert, enter the email of the user or group who will receive the alert on the *User Profile*:

Steps:

1. On the toolbar, click the user icon .

The *Profile* pane displays with the name of the user and the role.

2. Click *View Profile*.

The *User Profile* page displays.

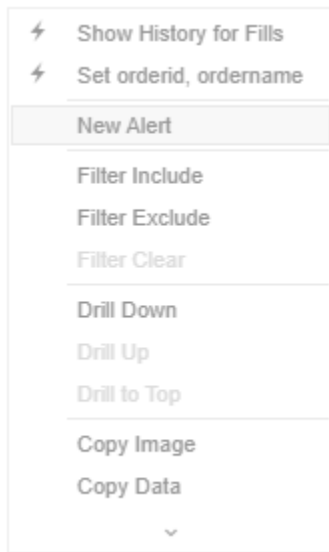

3. Enter the *Email Address*.

4. Click .

Steps:

1. Open a workbook on the Web client and right-click on a streaming numeric or text data in a visualization. Select *New Alert* on the context menu.

The *Alerts* dialog displays with the name of the visualization where the alert will be set.

A screenshot of the 'Alerts' dialog box. The title is 'Alert for Text Alert > Region and Country' with an 'Activated' toggle switch. The 'Name' field contains 'Alert1'. The 'Description' field is empty. Below is a table with columns 'Variable', 'Condition', and 'Limit'. The table has one row: 'Country', 'TextUnique(Country)', 'Equals'. Below the table, there are fields for 'For the last' (30), 'second(s)', 'Breakdown' (Region), 'Parameters' (empty), 'Action Limit' (max 1 per hour(s)), 'Send E-mail' (on enter/leave), 'Include visualization image' (checked), 'Use current drill path' (unchecked), 'CC' (example@domain.com,example@domain.com,...), 'Sound' (unchecked), 'Webhook' (0 of 5), and 'Active Hours' (unchecked). At the bottom right are 'OK' and 'Cancel' buttons.

2. Enter or select the following properties:

Property	Description
Name	Name of the alert.
Description	Description of the alert.
Variable	Available variable columns in the visualization where the alert is set.
Condition	Allows setting the following <i>Limit</i> of all the available numeric variables in the visualization: <ul style="list-style-type: none"> • Upper or Equal To (<=) • Lower or Equal To (>=) • Upper values (<)

	<ul style="list-style-type: none"> • Lower values (>) • Between – values between the <i>Lower</i> and <i>Upper</i> values <p>For text variables, there are four types of conditions:</p> <ul style="list-style-type: none"> • Equals - The string is equal to another string, e.g., Country=Sweden • Not Equals – The string is not equal to another string • Wildcard: The string matches a wildcard expression, e.g., Country=Norwa* would match Country=Norway • Regex: The string matches a regex expression, e.g., Country=[a-zA-Z]+a would match Country=India and Country=Indonesia
For the Last	<p>Checks if a value has reached the limit on the set Date/Time unit:</p> <ul style="list-style-type: none"> • second(s) • minute(s) • hour(s) • day(s)
Breakdown	Current breakdown of the visualization.
Parameters	Available parameters in the visualization.
Action Limit	<p>The maximum number of times an alert will be sent on the set Date/Time unit:</p> <ul style="list-style-type: none"> • second(s) • minute(s) • hour(s) • day(s)
Send E-mail	<p>Determines when an alert email will be sent:</p> <ul style="list-style-type: none"> • on enter • on leave • on enter/leave <p>If unchecked, the notification will only be displayed on the Web client.</p>
Include	<p>Determines whether the image of the visualization or dashboard will be included in the alert email.</p> <p>For the included image of the visualization, check the Use current drill path box to generate a drilled image in the email.</p>
CC	CC mailing groups that will receive the alert, separated by a comma.
Sound	<p>The sound that will be played for a triggered alert. The available sounds are mp3 files placed in the AppData/Sounds folder (i.e., C:\vizserverdata\Sounds). Panopticon is shipped with one sound (i.e., bell_ping_1s.mps).</p>  <p>Default is None.</p>
Webhook	Webhooks that will be executed when the alert is triggered.

Active Hours	Determines when an alert should be active. Proceed to step 3.
--------------	---

3. Check the *Alert Hours* box. The dialog changes to display:

Alert for Simple Summary > By Algo Activated

Active Hours

from

MONDAY
 TUESDAY
 WEDNESDAY
 THURSDAY
 FRIDAY
 SATURDAY
 SUNDAY

Show in Timezone

By default, the duration is from **9:00 AM** to **5:00 AM** on **Monday, Tuesday, Wednesday, Thursday, and Friday**.

4. To modify the *Active Hours*, click .
The *Clock* settings display.

09	00	AM
10	01	PM
11	02	
12	03	
01	04	
02	05	
03	06	

5. Select the *Hour*, *Minutes*, and *AM/PM* settings.
6. To modify the *Active Days*, check the boxes of the desired days.
7. To apply the active hours in another time zone, select the desired value from the *Show in Timezone* drop-down list box.

Once set, the *From* and *To* limits will be applied for that time zone. If not set, the server default time zone will be used.

8. Tap the *Activated* slider to turn it on.

9. Click . The new alert is added on the *Alerts Definition* page.

NOTE When creating alerts for grand total, ensure that no breakdown is set.

An alert displays with the following properties or settings:

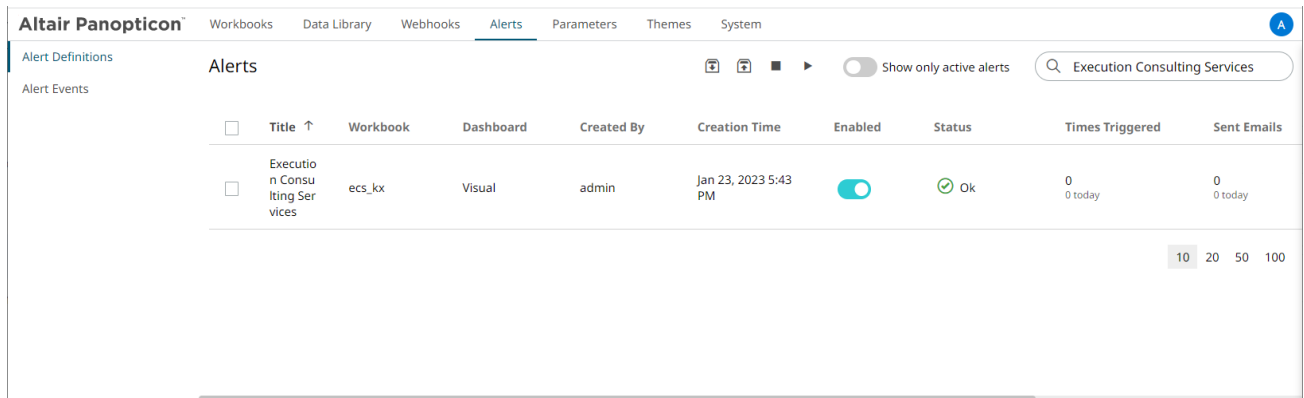

Property	Description
Title	Name of the alert that was entered in the <i>Alerts</i> dialog.
Workbook	The path and name of the workbook where the alert was set.
Dashboard	The dashboard name where the alert was set.
Created By	The author of the alert.
Creation Time	The Date/Time when the alert was set.
Enabled	Determines if the alert is enabled (or active).
Status	Status of the alert.
Times Triggered	The number of times the alert was triggered.
Sent Emails	The number of emails sent.
Notifications	The number of notifications sent.
Triggered Webhooks	The number of triggered webhooks .

Sorting Alerts

By default, the list of alerts is sorted by *Title* in an ascending order. You can modify the sorting of the list by clicking the  or  button of the *Title*, *Workbook*, *Dashboard*, *Created By*, *Creation Time*, *Enabled*, *Status*, *Times Triggered*, *Sent Emails*, or *Notifications* columns. The icon beside the column that was used for the sorting will indicate if it was in an ascending or descending order.

Searching for Alerts

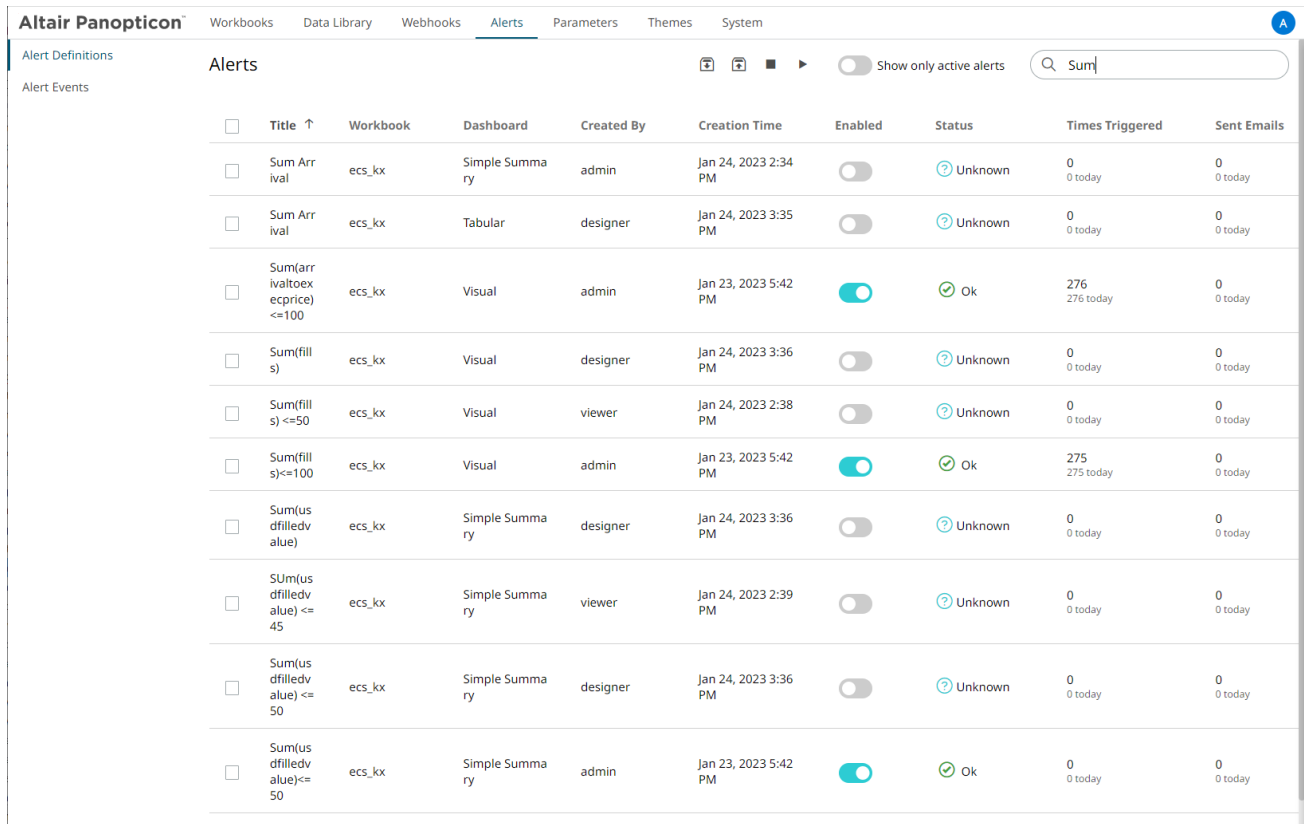

To search for a particular alert, enter it in the *Search* box.

The screenshot shows the Altair Panopticon interface with the 'Alerts' tab selected. A search box at the top right contains the text 'Execution Consulting Services'. Below the search box, a table lists alerts. The first alert is 'Execution Consulting Services' with a status of 'Ok' and 0 triggers today.

<input type="checkbox"/>	Title ↑	Workbook	Dashboard	Created By	Creation Time	Enabled	Status	Times Triggered	Sent Emails
<input type="checkbox"/>	Execution Consulting Services	ecs_kx	Visual	admin	Jan 23, 2023 5:43 PM	<input checked="" type="checkbox"/>	Ok	0 0 today	0 0 today

You can also enter one or more characters into the *Filter Applications* box and the suggested list of alerts that matched the entries will be displayed.

The screenshot shows the Altair Panopticon interface with the 'Alerts' tab selected. A search box at the top right contains the text 'Sum'. Below the search box, a list of alerts is displayed, filtered by the search term. The list includes various alerts such as 'Sum Arrival', 'Sum(arrivaltoexceprice) <=100', and 'Sum(usdfilledvalue) <=50'.

<input type="checkbox"/>	Title ↑	Workbook	Dashboard	Created By	Creation Time	Enabled	Status	Times Triggered	Sent Emails
<input type="checkbox"/>	Sum Arrival	ecs_kx	Simple Summary	admin	Jan 24, 2023 2:34 PM	<input type="checkbox"/>	Unknown	0 0 today	0 0 today
<input type="checkbox"/>	Sum Arrival	ecs_kx	Tabular	designer	Jan 24, 2023 3:35 PM	<input type="checkbox"/>	Unknown	0 0 today	0 0 today
<input type="checkbox"/>	Sum(arrivaltoexceprice) <=100	ecs_kx	Visual	admin	Jan 23, 2023 5:42 PM	<input checked="" type="checkbox"/>	Ok	276 276 today	0 0 today
<input type="checkbox"/>	Sum(fill s)	ecs_kx	Visual	designer	Jan 24, 2023 3:36 PM	<input type="checkbox"/>	Unknown	0 0 today	0 0 today
<input type="checkbox"/>	Sum(fill s) <=50	ecs_kx	Visual	viewer	Jan 24, 2023 2:38 PM	<input type="checkbox"/>	Unknown	0 0 today	0 0 today
<input type="checkbox"/>	Sum(fill s) <=100	ecs_kx	Visual	admin	Jan 23, 2023 5:42 PM	<input checked="" type="checkbox"/>	Ok	275 275 today	0 0 today
<input type="checkbox"/>	Sum(usdfilledvalue)	ecs_kx	Simple Summary	designer	Jan 24, 2023 3:36 PM	<input type="checkbox"/>	Unknown	0 0 today	0 0 today
<input type="checkbox"/>	Sum(usdfilledvalue) <=45	ecs_kx	Simple Summary	viewer	Jan 24, 2023 2:39 PM	<input type="checkbox"/>	Unknown	0 0 today	0 0 today
<input type="checkbox"/>	Sum(usdfilledvalue) <=50	ecs_kx	Simple Summary	designer	Jan 24, 2023 3:36 PM	<input type="checkbox"/>	Unknown	0 0 today	0 0 today
<input type="checkbox"/>	Sum(usdfilledvalue) <=50	ecs_kx	Simple Summary	admin	Jan 23, 2023 5:42 PM	<input checked="" type="checkbox"/>	Ok	0 0 today	0 0 today

Enabling Alerts on the Alerts Page

Tap the **Enabled** slider to turn it on.

The screenshot shows the 'Alerts' page in Altair Panopticon. The interface includes a navigation bar with 'Alerts' selected, a search bar, and a 'Show only active alerts' toggle. A table lists alert definitions with columns for Title, Workbook, Dashboard, Created By, Creation Time, Enabled, Status, Times Triggered, and Sent Emails. The 'Enabled' column for the last row, 'Sum(usdfiledvalue)<=50', is highlighted with a red arrow pointing to the right, indicating the slider is being turned on.

<input type="checkbox"/>	Title ↑	Workbook	Dashboard	Created By	Creation Time	Enabled	Status	Times Triggered	Sent Emails
<input type="checkbox"/>	Execution Consulting Services	ecs_kx	Visual	admin	Jan 23, 2023 5:43 PM	<input checked="" type="checkbox"/>	Ok	0 0 today	0 0 today
<input type="checkbox"/>	Pcntfiled <= 45	ecs_kx	Simple Summary	admin	Feb 17, 2023 9:32 PM	<input type="checkbox"/>	Unknown	0 0 today	0 0 today
<input type="checkbox"/>	Sum Arrival	ecs_kx	Simple Summary	admin	Feb 17, 2023 9:32 PM	<input type="checkbox"/>	Unknown	0 0 today	0 0 today
<input type="checkbox"/>	Sum(arrivaltoexecprice) <=100	ecs_kx	Visual	admin	Jan 23, 2023 5:42 PM	<input checked="" type="checkbox"/>	Ok	607 607 today	0 0 today
<input type="checkbox"/>	Sum(fill s) <=50	ecs_kx	Visual	viewer	Jan 24, 2023 2:38 PM	<input type="checkbox"/>	Unknown	0 0 today	0 0 today
<input type="checkbox"/>	Sum(fill s)<=100	ecs_kx	Visual	admin	Jan 23, 2023 5:42 PM	<input checked="" type="checkbox"/>	Ok	606 606 today	0 0 today
<input type="checkbox"/>	Sum(usdfiledvalue)	ecs_kx	Simple Summary	designer	Jan 24, 2023 3:36 PM	<input type="checkbox"/>	Unknown	0 0 today	0 0 today
<input type="checkbox"/>	Sum(usdfiledvalue)<=50	ecs_kx	Simple Summary	admin	Jan 23, 2023 5:42 PM	<input checked="" type="checkbox"/>	Unknown	0 0 today	0 0 today

The screenshot shows the 'Alerts' page in Altair Panopticon, identical to the previous one, but with the 'Enabled' slider for the last row, 'Sum(usdfiledvalue)<=50', turned on. The slider is now a blue circle on the right, and the status is 'Ok'.

<input type="checkbox"/>	Title ↑	Workbook	Dashboard	Created By	Creation Time	Enabled	Status	Times Triggered	Sent Emails
<input type="checkbox"/>	Execution Consulting Services	ecs_kx	Visual	admin	Jan 23, 2023 5:43 PM	<input checked="" type="checkbox"/>	Ok	0 0 today	0 0 today

Activating or Deactivating All Alerts

Alerts can be activated or deactivated in one click.

To activate all deactivated alerts, click **Activate All** . All of the deactivated alerts are activated.

To deactivate all activated alerts, click **Deactivate All** . All of the activated alerts are deactivated.

Click  to close the dialog.

Viewing Triggered Alerts

View the details of all the triggered events of [activated](#) alerts.

Steps:

1. Click the **Alert Events** tab on the *Alerts* page.
The *Alerts Triggered Events* page displays with the following information.

Altair Panopticon™ Workbooks Data Library Webhooks Alerts Parameters Themes System

Alert Definitions Alerts Clear All

Alert Events

NOTE: Alert Events are recorded as long as the page is kept open in the web browser, closing, or navigating away from the page will clear the list.

Trigger Time	Title	Description	Workbook Name	Dashboard
Feb 20, 2023 1:35:35 pm	Sum(fill s)<=100	algotype:Opportunistic, algoname:Pairs Trading, sym:O12846, order...	ecs_kx	Visual
Feb 20, 2023 1:35:24 pm	Sum(arr ivaltoex eprice) <=100	Order Name:BIT-A2A BUY 4k, Arrival to Exec=-0.001589932	ecs_kx	Visual

10 20 50 100

Property	Description
Trigger Time	The Date/Time when the alert was triggered.
Title	Title of the alert.
Description	Description the alert.
Workbook Name	The workbook name where the alert was set.
Dashboard	The dashboard name where the alert was set.

NOTE Alert events are recorded as long as the page is kept open in the web browser. Closing or navigating away from the page will clear the list.

2. You can also do any of the following options:

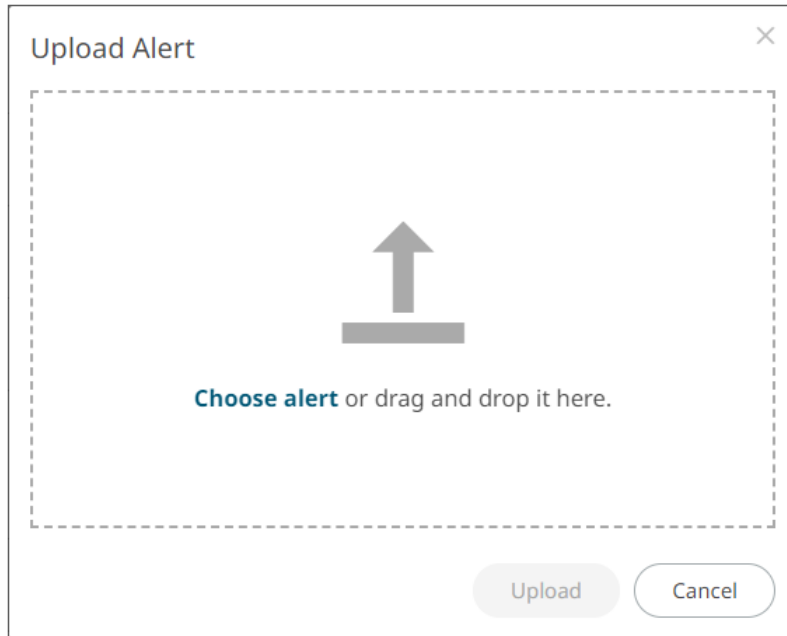

- Click or of a column title to sort the list.
- Enter a triggered alert title in the *Search* box to do a search.
- Click to delete a triggered alert.
- Click to clear the list.
- Click a **Title** link to go to the workbook where the alert was triggered.

Importing Alerts

Allows you to import alerts shared by other others.

Steps:

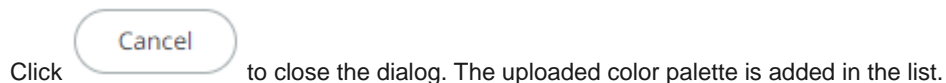

1. On the **Alert Definitions** tab, click the **Import Alerts** icon.
The *Upload Alert* dialog displays.

2. To upload an alert, do one of the following:
 - Drag the file from your desktop and drop on the dialog, or
 - Click **Choose alert** and then browse and select one on the *Open* dialog that displays.

A notification displays once the color palettes file is uploaded.

Exporting Alerts

You can download a copy of any of the alerts.

Steps:

1. On the *Alerts* list, select the checkbox of the alerts you want to export.
2. Click **Export Alerts**  icon.
The selected alerts are downloaded.

Modifying Alert Settings

Steps:

1. Open a workbook with an alert and click on the **Alerts**  icon.
The *Alerts* panel displays with the list of alerts.

The screenshot displays the Panopticon software interface. On the left is a table of orders with columns for Order Name, Total Order \$, % Filled, and D. P. The middle section contains three charts: Order Map (a grid of order types like Opportunistic, Liquidity Driven, etc.), Order Scatter (a scatter plot of Slippage vs Participation), and Client Order Details for Order EU-BNP BUY 1250k [O12814] (a table showing fills for XPAR, XGRM, and TRQX). On the right is the Alerts panel with several toggle switches for various alert types.

2. Click an alert to modify.
The Alerts dialog displays.

3. Make the necessary changes then click **OK** to save them.

Deleting Alerts

Alerts can be deleted on:

- the Alerts panel
- an Alerts dialog
- the Alerts tab

Deleting Alerts on the Alerts Panel:

1. Open a workbook with an alert and click on the **Alerts** icon.
The Alerts panel displays with the list of alerts.

The screenshot displays the Panopticon software interface. At the top, there are navigation tabs: Cover, Intro, Tabular, Simple Summary, Visual (selected), History for Fills, and Playback. The user is logged in as 'ecs_kx'. The main area is divided into several panels:

- Order Map:** A central visualization showing order flow with various order types and sizes. It includes filters for 'algotype', 'algoname', 'orderid', and 'ordername'. The size is set to 'usdunfilledvalue' and color is 'arrivaltoorderwpa'. It features sub-sections for 'Opportunistic', 'Liquidity Driven', 'Impact Driven', and 'Spread'. Specific order IDs like O13075, O12989, O1296, O13019, O12, O13008, O13003, O12813, O1300, and O1274/O1284 are visible.
- Order Scatter:** A scatter plot showing 'Slippage (Arrival to Exec)' on the y-axis and 'Participation' on the x-axis. It includes filters for 'Height', 'arrivaltoorderwpa', 'Size', 'Unfilled \$', and 'X Participation'. A specific order 'L-SHP SELL 1' is highlighted.
- Alerts:** A panel on the right with a list of alerts and checkboxes. The alerts are:
 - Execution Consulting Services (checked)
 - Sum(fills) (checked)
 - Sum(offer) (checked)
 - Sum(usdfilledvalue)<=10 (checked)
 - Sum(usdfilledvalue)<=50 (checked)
- Client Order Details for Order EU-BNP BUY 1250k [O12814]:** A table showing order execution details across different venues.

	fills	ordersize	Filled Size	participation	Filled Value	execvaluecum	Diff to Venue Price %	Diff to Best Venue Price %	Venue P&L	Best P&L
XPAR	84	1,250,000	414,332	217.81%	16,900,000		0.02%	0.04%	5,023

TRQX	41	1,250,000	187,107	109.90%	7,632,518		0.01%	0.02%	2,352	
					0.00					

2. Check the box of an alert and click the **Delete**  icon. You can also check several boxes to delete multiple alerts.

Deleting Alerts on an Alerts Dialog:

1. Open a workbook with an alert and click on the **Alerts**  icon.
The *Alerts* panel displays with the list of alerts.

The screenshot displays the Panopticon software interface. On the left is a table of orders with columns for Order Name, Total Order \$, % Filled, and D. The main area is divided into three panels: Order Map (top right), Order Scatter (middle right), and Alerts (far right). The Order Map shows various order types like Opportunistic, Liquidity Driven, and Impact Driven. The Order Scatter is a bubble chart showing Slippage (Arrival to Exec) vs Participation. The Alerts dialog is open, showing a list of alerts with checkboxes for Execution Consulting Services, Sum(fills), Sum(offering), Sum(usdfilledvalue)<=10, and Sum(usdfilledvalue)<=50. Below the Order Scatter is a table titled 'Client Order Details for Order EU-BNP BUY 1250k [O12814]'.

	fills	ordersize	Filled Size	participation	Filled Value	execvaluecum	Diff to Venue Price %	Diff to Best Venue Price %	Venue P&L	Best P&L
XPAR	84	1,250,000	414,332	217.81%	16,900,000		0.02%	0.04%	5,023	
XGRM	43	1,250,000	206,262	104.40%	8,412,594		0.00%	0.07%	1,831	
TRQX	41	1,250,000	187,107	109.90%	7,632,518		0.01%	0.02%	2,352	
						0.00				

2. Click an alert. The **Alerts** dialog displays.

3. Click the **Delete**  icon.

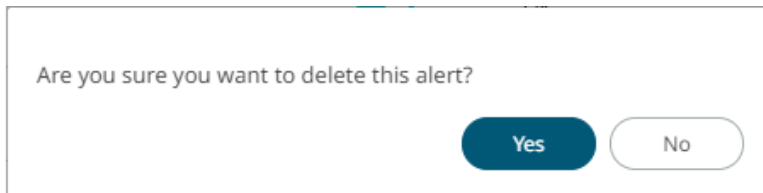

Deleting Alerts on the Alerts tab:

1. Go to the **Alerts** tab.

The **Alerts** tab displays the list of alerts.

3. Click the  of an alert to delete.

A confirmation message displays.

4. Click .

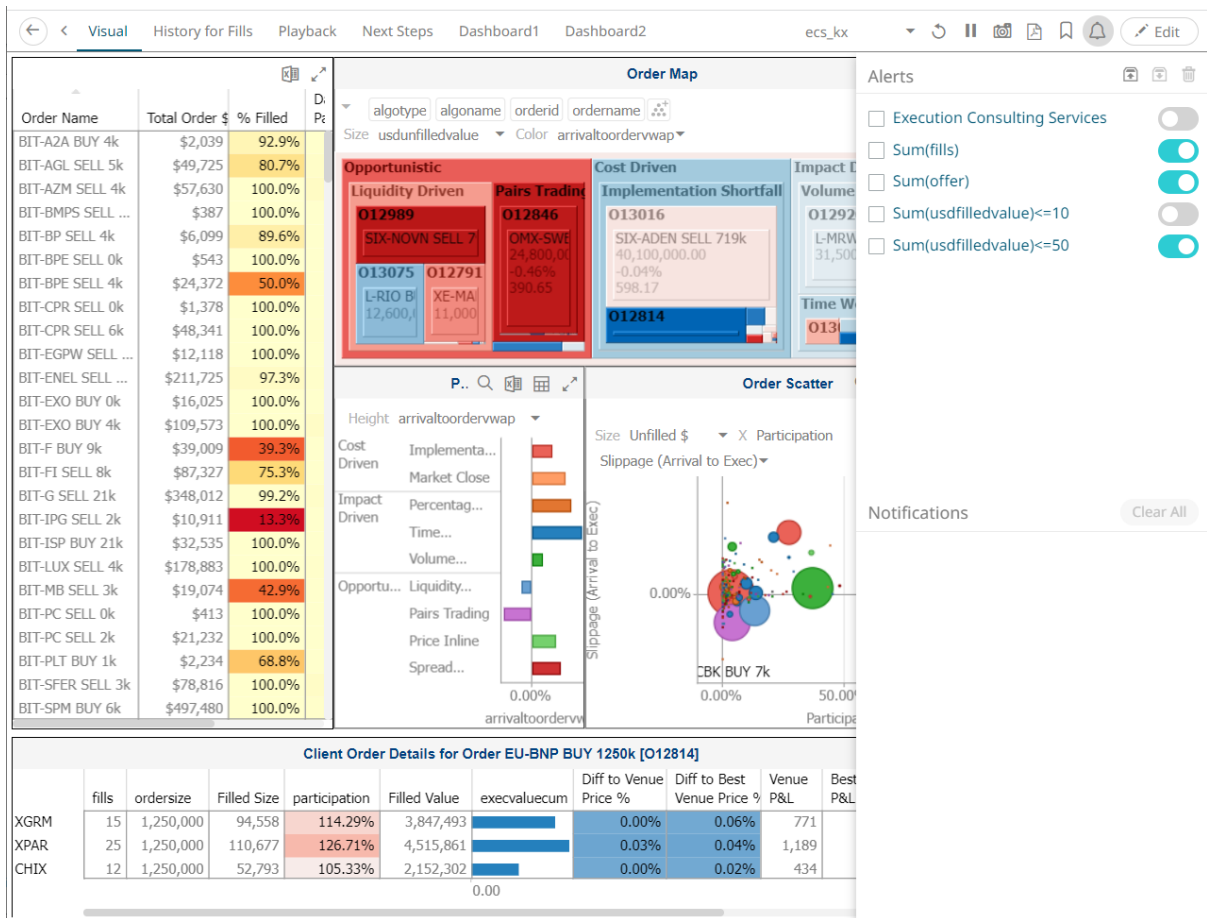

Enabling Alerts

Alerts can be enabled either on:

- the Alerts panel
- an Alerts dialog

Enabling Alerts on the Alerts Panel:

1. Open a workbook with an alert and click on the **Alerts**  icon.
The *Alerts* panel displays with the list of alerts.

4. Tap the Activated slider to turn it on and click

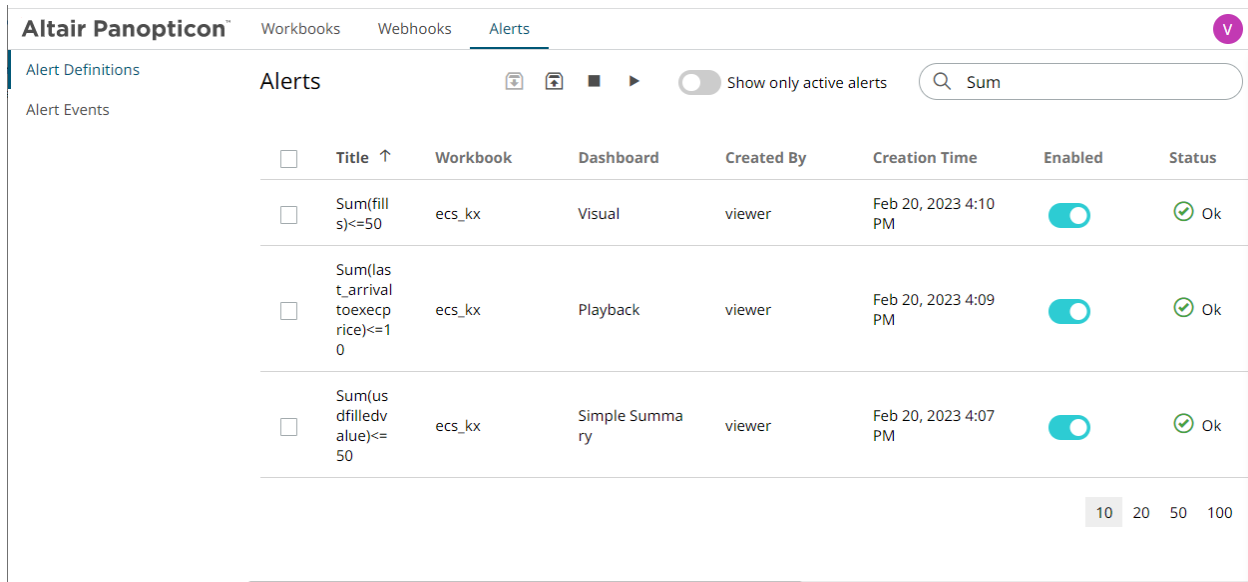

Viewing and Managing Alerts for Non-Administrator users

There are three tabs that are available for non-Administrator users:

Click on the **Alerts** tab to view and manage the available alerts.

<input type="checkbox"/>	Title ↑	Workbook	Dashboard	Created By	Creation Time	Enabled	Status
<input type="checkbox"/>	Sum(fill s)<=50	ecs_kx	Visual	viewer	Feb 20, 2023 4:10 PM	<input checked="" type="checkbox"/>	Ok
<input type="checkbox"/>	Sum(last_arrival toexecution)<=10	ecs_kx	Playback	viewer	Feb 20, 2023 4:09 PM	<input checked="" type="checkbox"/>	Ok
<input type="checkbox"/>	Sum(usedfilledvalue)<=50	ecs_kx	Simple Summary	viewer	Feb 20, 2023 4:07 PM	<input checked="" type="checkbox"/>	Ok

Also perform any of the following operations:

- [Sort alerts](#)
- [Search for alerts](#)

- [Enable an alert](#)
- [Delete alerts](#)
- [Display active alerts](#)
- [Deactive/activate all alerts](#)
- [View Alerts Triggered Events](#)
- [Importing Alerts](#)
- [Exporting Alerts](#)

Click the user icon  and click **View Profile**. Then enter email of the user or group who will receive the alert.

User Profile

Email Address

mvillanueva@altair.com

Update Email Address

Click **Update Email Address**.

SAMPLE EMAIL ALERTS

An alert is generated when the alert set state changes from **Off** to **On** and recorded in the alert history.

An alert is only issued by email if the alert has not already been sent in the last 'n' minutes as defined in the *Alerts* dialog.

When an alert is issued, an email is sent to the defined email address.

The email includes:

- Link to the workbook or dashboard
- Condition and limit value
- Breakdown
- Name of the visualization where the alert was set
- PNG image of the visualization or dashboard

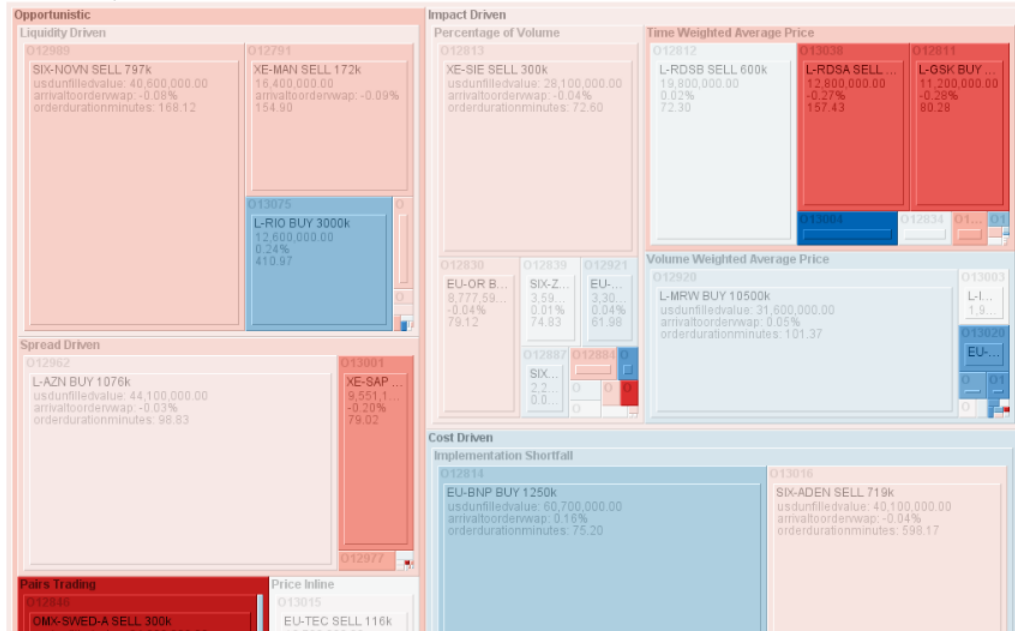

Dashboard: http://localhost:8080/panopticon/workbook/#/ecs_kx/Visual

Condition: Sum(fills) >= 10.0

The alert was triggered by the following items:

algotype:Opportunistic, algoname:Liquidity Driven, sym:O12989, ordername:SIX-NOVN SELL 797k

Visual > Order Map

SAMPLE WEB CLIENT ALERTS

When an alert is triggered, aside from the email notifications, a visual indication or pop-up in active Web clients will draw attention to the alerting visualization or dashboard.

In the example below, an alert initially displays highlighted in blue:

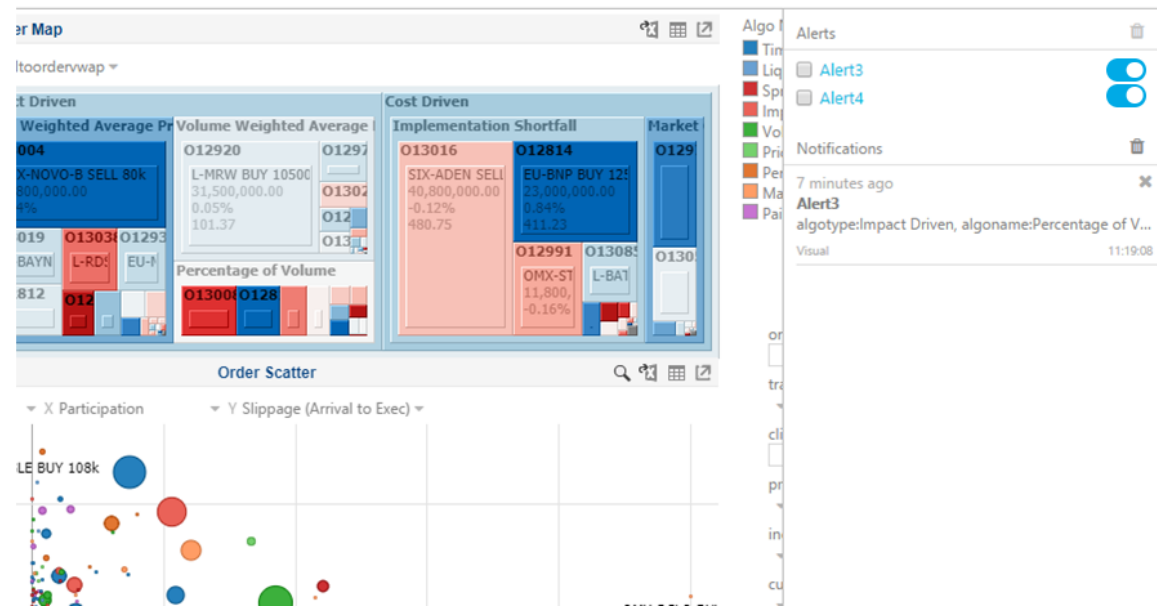

The alert eventually fades away and the pop-up screen fills up with the four latest triggered alerts.

The pop-up stays on screen until it is closed by clicking the button.

Saved alert notifications can be opened on the *Notifications* panel by clicking the icon.

Clicking on a notification highlights the item in the workbook that triggered the alert.

Click the  button to delete a notification or click  to delete all of the notifications.

[13] GLOBAL PARAMETERS

The **Parameters** tab supports adding, modifying, and deleting global parameters that will pull and enter specific data into the different sets that are assigned to workbook folders, as well as user specific folders.

For example:

Altair Panopticon™ Workbooks Data Library Webhooks Alerts Parameters Themes System

Parameters Refresh

Folder	Name	Type	Value	Encrypted
Global				
Global	OrderBook			
Global	OrderBook	BidAsk		
Global	~			
Global	~designer			

Applies to all workbooks ←

Applies to all public workbooks ←

Applies to all private workbooks ←

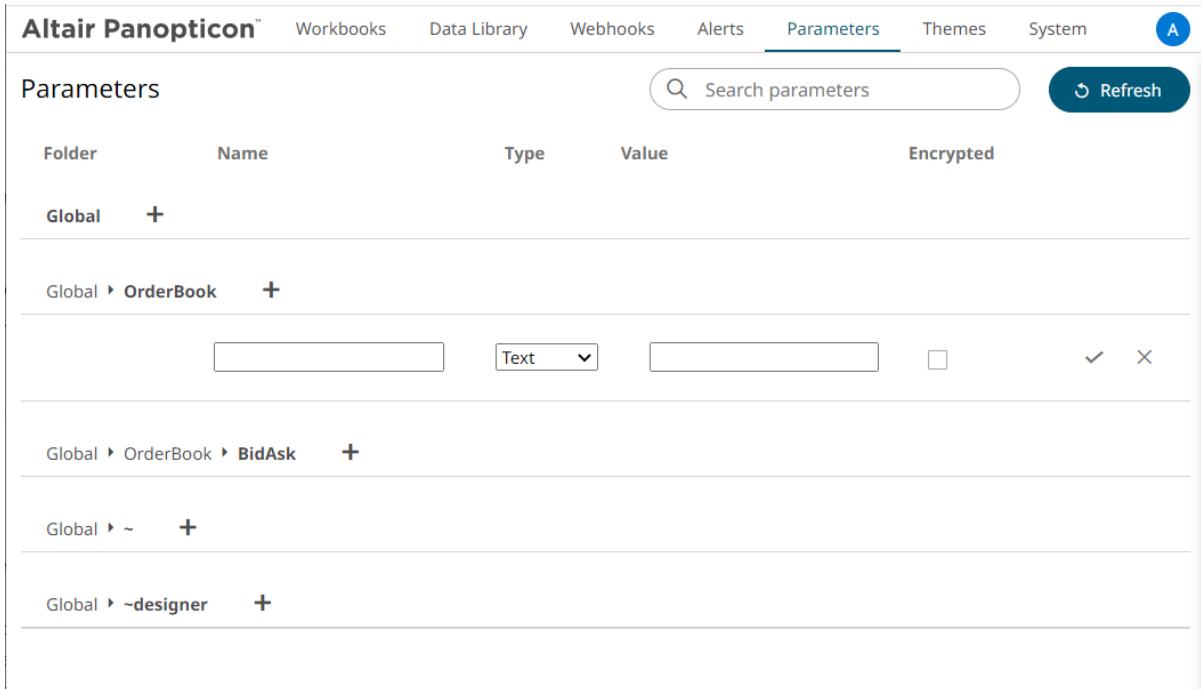

Parameters Set In	Description
Organization's root folder (i.e., Global)	Inherited by all of the available folders and applied to all workbooks
Public root folder (e.g., Global > Orders)	Inherited by the public root folder's subfolders and applied to all public workbooks.
User's root folder (i.e., Global > ~)	Inherited by the user root folder's subfolders and applied to all private workbooks.

ADDING PARAMETERS

Follow the steps below to add global parameters with an Administrator role.

Steps:

1. On the **Parameters** tab, click the Add  icon of a global folder (root or subfolder).
A new parameter entry displays.

2. Enter a *Name* for the new parameter.
3. Select the *Type*: **Text**, **Numeric**, or **Time**.
4. Enter the *Default Value*.

NOTE	<ul style="list-style-type: none"> • You can enter several default values, separated by a comma. • Single quotes on parameter value/s are removed when saving global parameters. • For the Time type, the following formats for the default value are accepted: <ul style="list-style-type: none"> ○ "yyy-MM-dd" ○ "yyy-MM-ddTHH:mm:ss" ○ "yyy-MM-ddTHH:mm:ss.SSS"
-------------	--

5. Check the *Encrypted* box to encrypt the value, if required.

NOTE	Encryption is only supported for text parameters.
-------------	---

6. Click . The new parameter is added in the list.
Global parameters added in the parent/root folder are inherited by the corresponding subfolders.

DELETING PARAMETERS

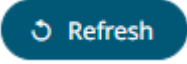

Steps:

1. On the **Parameters** tab, click the **Remove** icon  of a parameter.
A confirmation message displays.

2. Click  to delete.

Refresh Parameters

Click  to refresh the values that are being pulled by the workbook models.

Searching Parameters

To search for a particular parameter, enter it in the *Search* box.

The screenshot shows the 'Parameters' page in Altair Panopticon. At the top, there is a navigation bar with 'Altair Panopticon™' and several menu items: 'Workbooks', 'Data Library', 'Webhooks', 'Alerts', 'Parameters' (which is highlighted), 'Themes', and 'System'. On the far right of the navigation bar is a blue circle with a white letter 'A'. Below the navigation bar, the page title 'Parameters' is on the left. To its right is a search box containing the text 'Region' and a magnifying glass icon. Further right is a dark blue button with a white refresh icon and the word 'Refresh'. Below these elements is a table with the following columns: 'Folder', 'Name', 'Type', 'Value', and 'Encrypted'. The table contains six rows of parameters, all with the name 'Region' and the value 'Europe'. The 'Folder' column shows a hierarchy: 'Global', 'Global > OrderBook', 'Global > OrderBook > BidAsk', 'Global > ~', and 'Global > ~designer'. Each row has a small square checkbox in the 'Encrypted' column and two icons (a pencil and a trash can) to the right of the 'Value' column.

Folder	Name	Type	Value	Encrypted
Global	Region	Text	Europe	<input type="checkbox"/>
Global > OrderBook	Region	Text	Europe	<input type="checkbox"/>
Global > OrderBook > BidAsk	Region	Text	Europe	<input type="checkbox"/>
Global > ~	Region	Text	Europe	<input type="checkbox"/>
Global > ~designer	Region	Text	Europe	<input type="checkbox"/>

You can also enter one or more characters into the *Search* box and the suggested list of parameters that matched the entries will be displayed.

[14] MANAGING WORKBOOK THEMES

Workbook themes are set of configurable settings that affect all colors and fonts of dashboards and visualizations in a workbook. This configuration also includes setting which among the [color palettes](#) will be available for the Color variable or shape palettes for the Shape variable in the visualizations. Furthermore, the general colors to be used in visualizations such as axis, background, border, and focus colors can be defined.

Theme files are independent of workbooks and can be uploaded to and downloaded from the server through the administration UI.

On an opened workbook, users can dynamically switch to one of the provided default workbook themes: **Light**, **Light2023**, **Dark**, or **Dark2023**.

The **Themes** tab allows management of these workbook themes which are stored in the repository on the server.

NOTE

In the previous versions of Panopticon, all of theme-related settings are part of the workbook style, making it difficult to dynamically switch styles (e.g., colors, fonts etc.)

When a workbook (created using versions before 17.5) is opened, all of the existing styles are extracted then saved as its inline workbook theme.

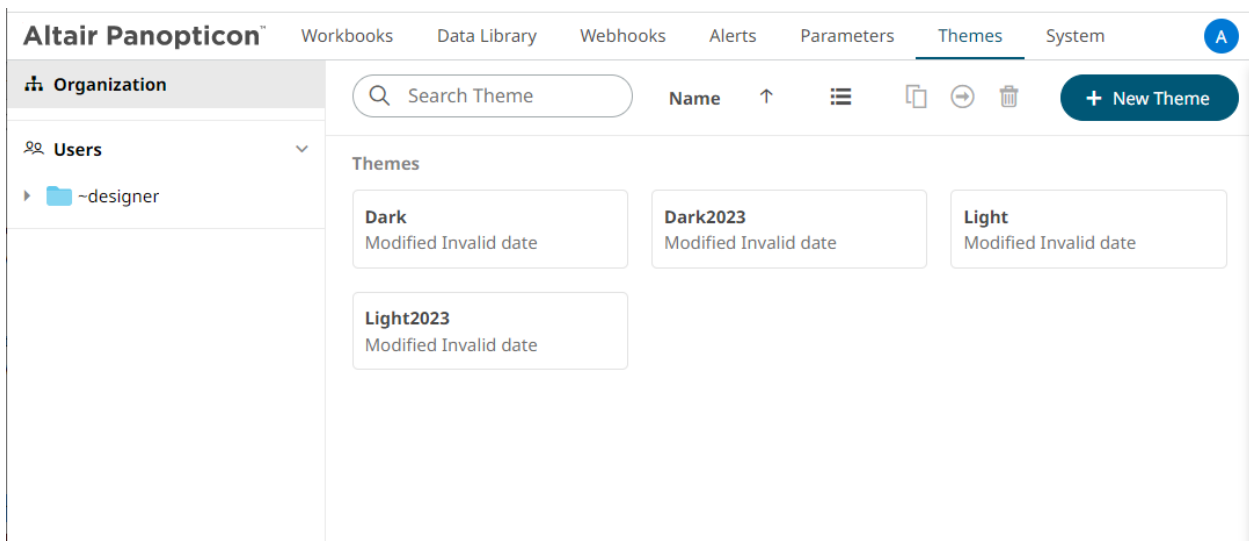

On the **Themes** tab, the following sections are available:

Property	Description
Search Theme	Entering text will filter the themes.
Toolbar	Allows copying, moving, and removing of themes. Also, to display the themes list either on List View or Grid View .
Create Theme	Allows creating new themes.
Theme Context Menu	Allows uploading , renaming , moving , copying , downloading , and deleting themes.

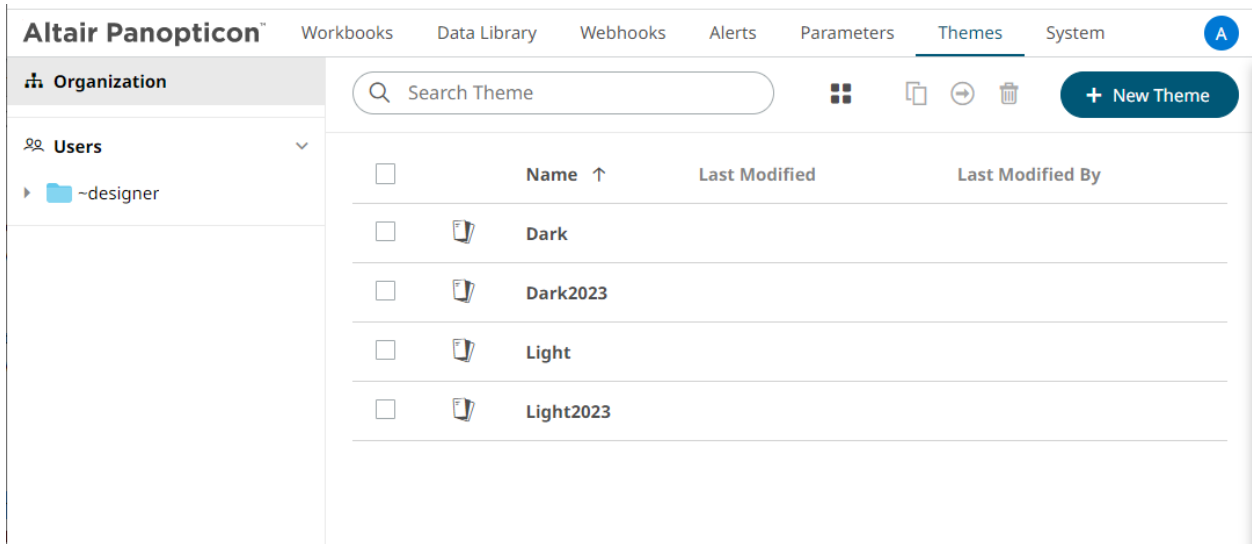

FOLDERS AND THEMES DISPLAY VIEW

Themes can be displayed either on a *List* or *Grid View*.

On the *Toolbar*, click **Grid View** . The folders and themes are displayed as thumbnails.

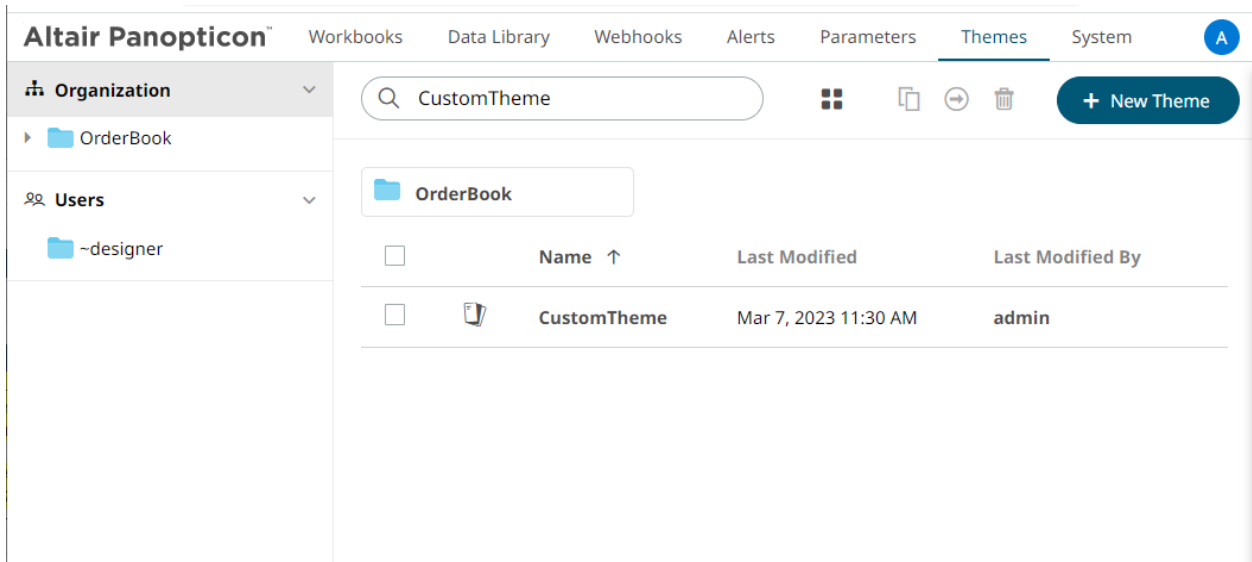

Or click **List View** , the themes are displayed in a standard listing.

On either display view style, clicking on a themes title or thumbnail displays the *Theme* page.

SEARCHING FOR THEMES

On the *Themes* tab, to search for a particular theme, enter it in the *Search Theme* box.

You can also enter one or more characters into the *Search Theme* box then click **Enter**. The suggested list of themes that matched the entries will be displayed.

Click on a theme to open the settings page.

To clear the filter, delete the text entry in the *Search Theme* box.

CREATING A NEW THEME

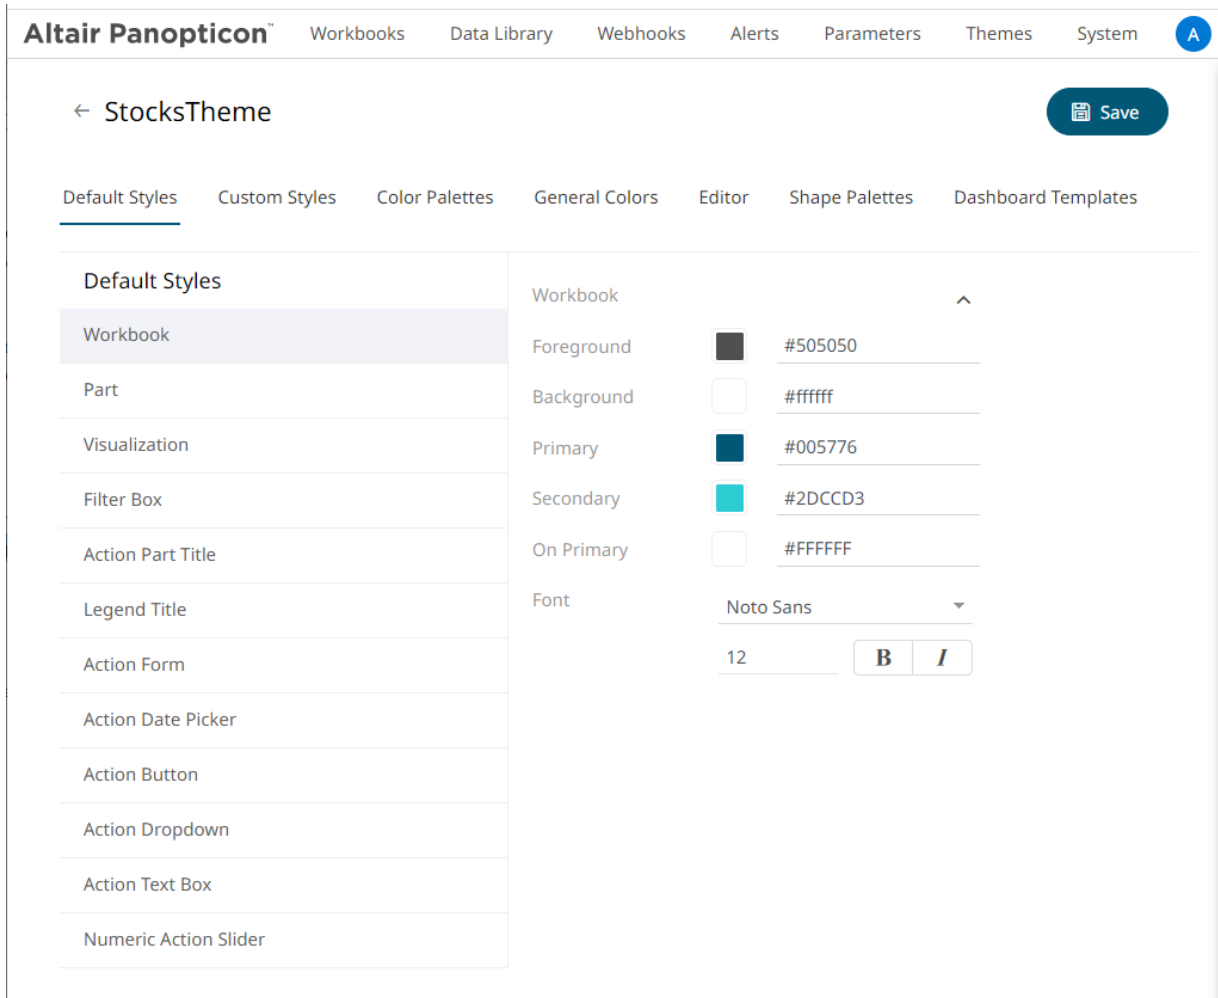

Creating a new theme allows setting the default or custom styles, color palettes, general colors, editor, and shape palettes to be used in workbooks and parts.

Steps:

1. On the *Themes* page, click . The *New Theme* dialog displays.

2. Enter the name of the theme then click . The new theme is displayed on the *Theme* page.

3. When creating a new theme, you may specify the following properties:
 - [Default Styles](#) – Define the default style settings of the workbook, parts, visualizations, filter box, action part title, legend title, and actions.
 - [Custom Styles](#) – Define the settings of the custom styles.
 - [Color Palettes](#) – Manage, import, or export Text, Sequential, and Diverging color palettes.
 - [General Colors](#) – Define or create duplicate general color.
 - [Editor](#) – Define the editor style settings.
 - [Shape Palettes](#) – Define the settings of shape palettes and add, upload, download, duplicate, or remove them.
 - [Dashboard Templates](#) – Update or delete default and new dashboard templates.

Define the Default Style Settings of a Theme

When you define the default settings of a theme, you specify the colors and fonts of the workbook, visualizations, filter box, action part title, legend title, and action form.

Steps:

1. To define the default styles of the workbook, click **Workbook** on the **Default Styles** tab. The *Workbook Settings* are displayed.

← StocksTheme Save

Default Styles Custom Styles Color Palettes General Colors Editor Shape Palettes Dashboard Templates

Default Styles	Workbook
Workbook	Foreground <input type="color" value="#505050"/> #505050
Part	Background <input type="color" value="#ffffff"/> #ffffff

THEMES TOOLBAR AND CONTEXT MENU

Moving, copying, and removing themes can either be done using:

- Context menu

Theme Context Menu

Theme Folder Context Menu

- Toolbar

List View

Grid View

The toolbar options include:

Toolbar Option	Description
Sort By / Sort Order	Allows sorting of themes by <i>Name</i> , <i>Last Modified</i> , or <i>Last Modified By</i> .
Display View	Display themes either by <i>List View</i> or <i>Grid View</i> .
Copy	Copy themes to another folder or subfolder where the user has permission.
Move	Move themes to another folder or subfolder where the user has permission.
Remove	Remove themes.

The context menu options include:

Toolbar Option	Description
Upload Theme	Upload theme.
Rename	Rename the theme.
Move	Move themes to another folder or subfolder where the user has permission.
Copy	Copy themes to another folder or subfolder where the user has permission.
Remove	Remove themes.

Sorting Themes

Sorting themes can be done by **Name**, **Last Modified**, or **Last Modified By**.

Steps:

On the *Themes* tab, either:

- click the **Sort By** option on the *Toolbar* of the *Grid View*.

By default, the sorting is by **Name**.

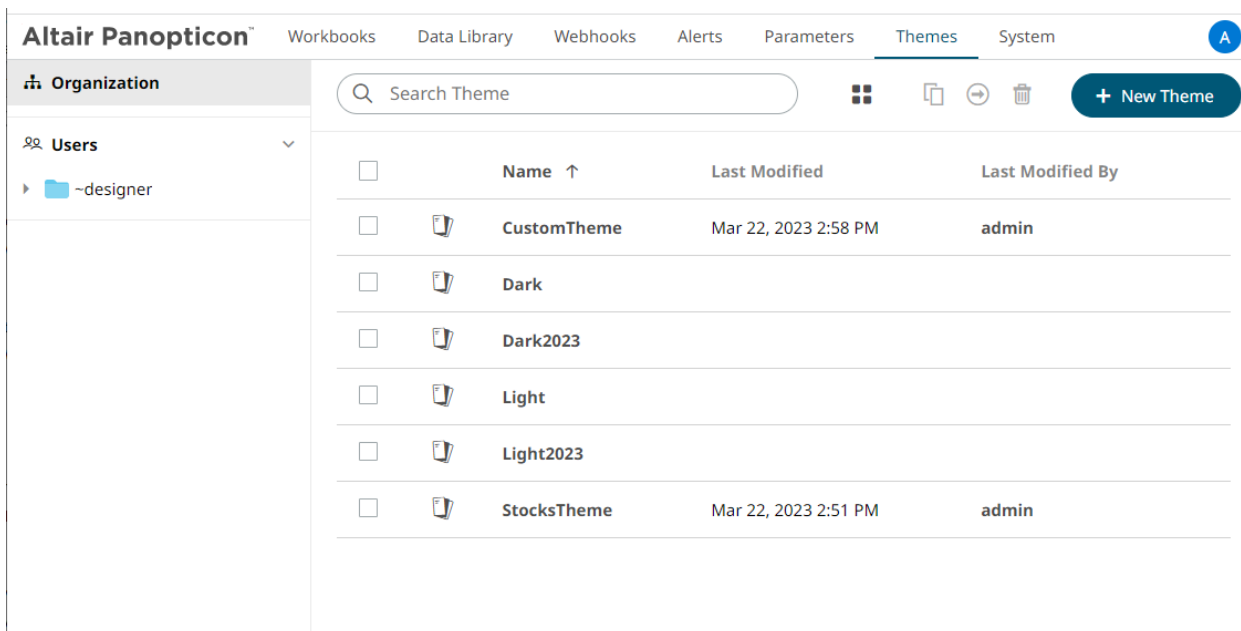

- Name
- Last Modified

Then click the *Sort Order*:

-  Ascending
-  Descending

- click on the **Name**, **Last Modified**, or **Last Modified By** column header of the *List View*.

Then click the *Sort Order*:

-  Ascending
-  Descending

Renaming a Theme

Steps:

1. Right-click on a theme then select **Rename** on the context menu.

The *Rename Theme* dialog displays.

2. Enter a new name then click  .

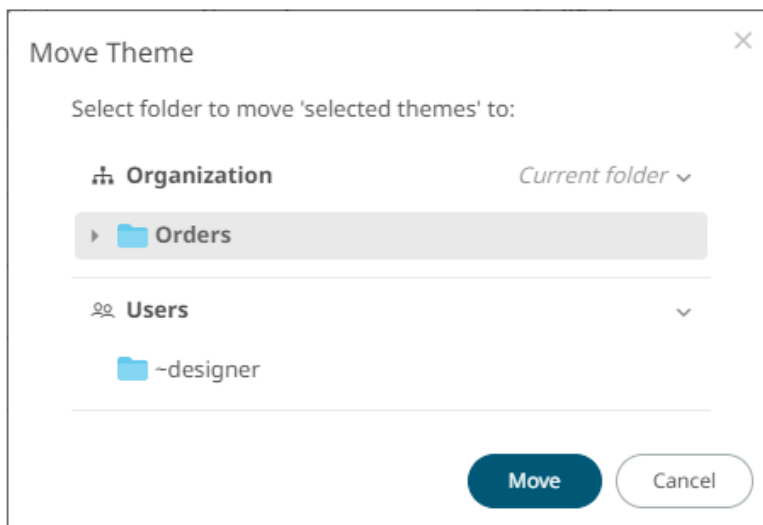

Moving Themes

Users with a Designer role are allowed to move themes to another folder or subfolder where they have permission.

Steps:

1. On the *List* or *Grid* view, select one or several themes then:
 - right-click and select **Move** on the context menu, or
 - click the **Move**  icon on the toolbar.

The *Move Theme* dialog displays with the folder or subfolders that the user is allowed to move the themes. Select the folder or subfolder.

2. Click  .

The themes are moved and displayed on the selected folder.

Copying Themes

Users with a Designer role are allowed to copy themes to another folder or subfolder where they have permission.

Steps:

1. On the *List* or *Grid* view, select one or several themes then:

- right-click and select **Copy** on the context menu, or
- click the **Copy**  icon on the toolbar.

The *Copy Theme* dialog displays with the folder or subfolders the user is allowed to copy the themes to. Select the folder or subfolder.

2. Click  .

The themes are copied and displayed on the selected folder.

Downloading Themes

On the *List* or *Grid* view, right-click on a theme and selected **Download** on the context menu to download a copy.

You can copy this file to the desired location.

Uploading Themes

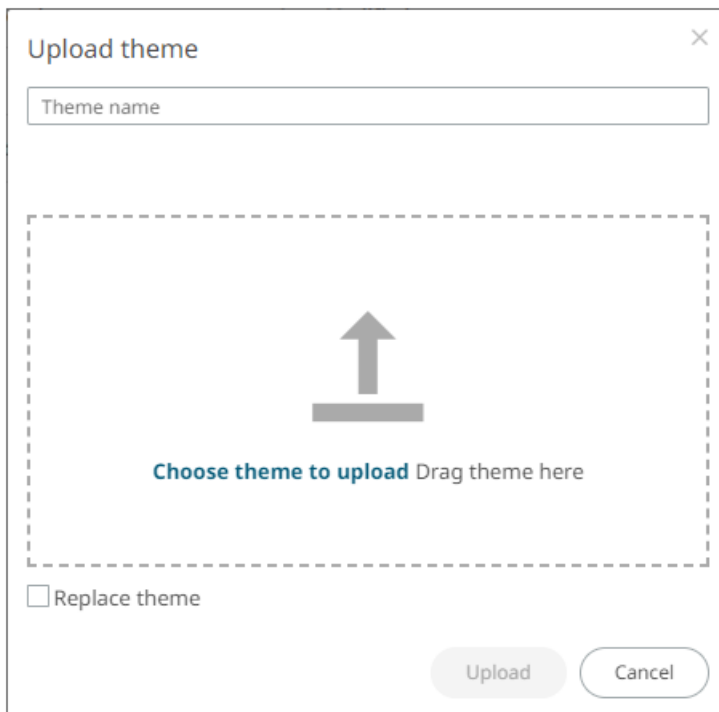

Users can upload their own workbook themes and also replace existing ones.

Steps:

1. Click on a folder or subfolder where the user has permission to upload a theme then select **Upload Theme** on the context menu.

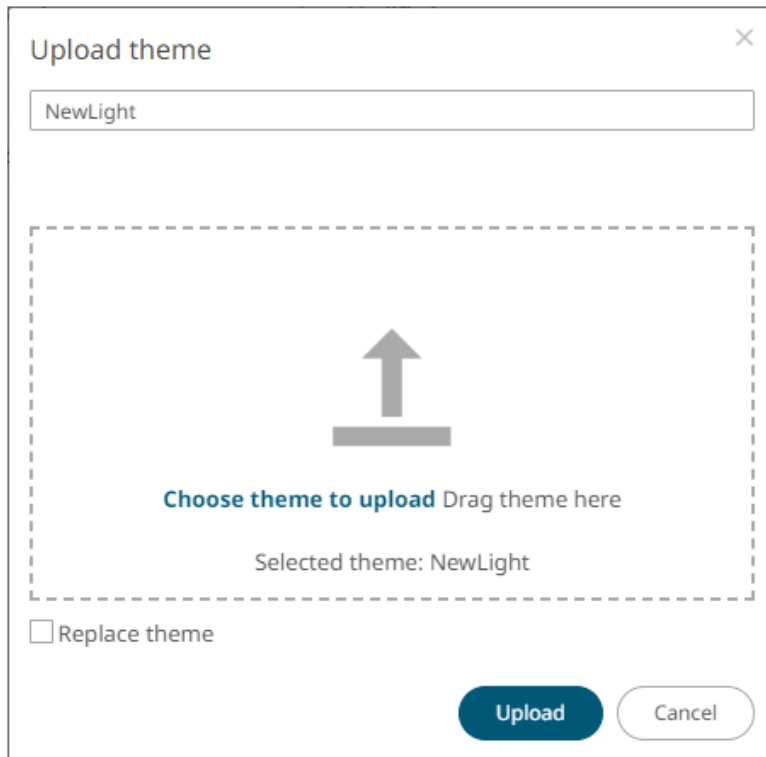

The *Upload Theme* dialog displays.

2. To upload a workbook theme, either:

- drag the file from your desktop and drop on the dialog, or
 - click **Choose theme to upload** and then browse and select one on the *Open* dialog that displays
- The name of the workbook theme is displayed on the uploaded workbook palette area and in the *Name* box.

You can opt to rename the uploaded workbook theme.

3. To replace the workbook theme, check the *Replace Theme* box.

4. Click  .

A notification displays once the file is uploaded.

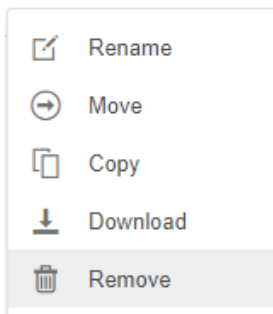

The uploaded theme is added in the *Theme* list.

Deleting Themes

The default themes (**Dark**, **Dark2023**, **Light**, and **Light2023**) cannot be removed.

Steps:

1. Right-click on one or two themes then either:
 - select **Remove** on the context menu, or

- click the **Remove**  icon on the toolbar.

A notification message displays.

2. Click  .

COLOR PALETTES

The [single](#), [sign](#), [text](#), [sequential](#), and [diverging](#) color palettes that is used in text or numeric color variables in visualizations can be created, imported, exported, [modified](#), [duplicated](#), or [deleted](#) in the **Color Palettes** tab of a *Theme* page.

<input type="checkbox"/>	Red-Yellow-Green-Print	<input type="radio"/>			

NOTE

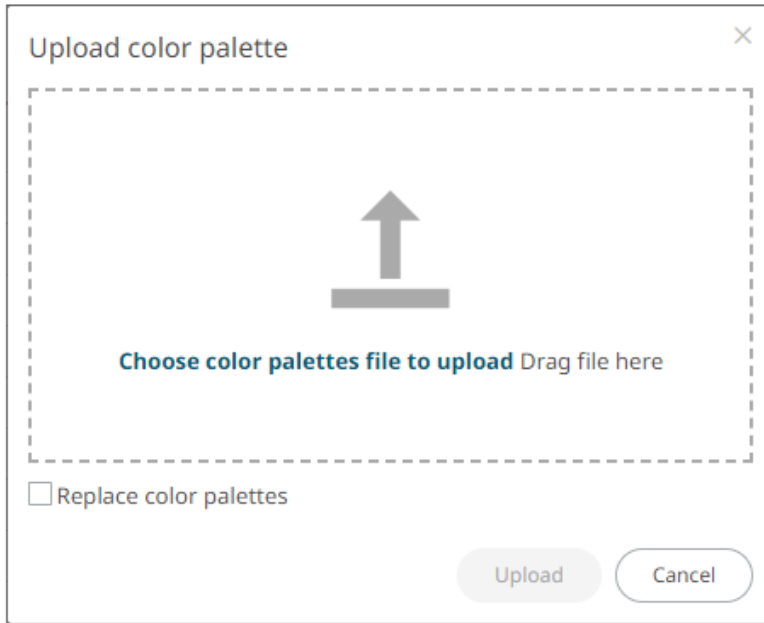

Creating, modifying, duplicating, or deleting color palettes can also be done inside a workbook in *Web Authoring*. However, these changes will only be associated with the inline theme of the workbook and will not be reflected in the **Color Palettes** tab of the *Themes* page in Panopticon Real Time.

Importing a Color Palette

Users can upload their own color palettes.

Steps:

1. On the *Color Palettes* pane, click . The *Upload Color Palette* dialog displays.

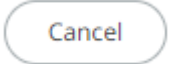

2. To upload a color palette, either:
 - drag the file from your desktop and drop on the dialog, or
 - click **Choose color palettes file to upload** and then browse and select one on the *Open* dialog that displays

The name of the color palette is displayed on the uploaded color palette area.

3. To replace the color palettes, check the *Replace Color Palettes* box.

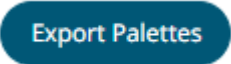

4. Click  .

A notification displays once the color palettes file is uploaded.

- Click  to close the dialog. The uploaded color palette is added in the list.

Exporting a Color Palette

You can download a copy of any of the color palettes.

- Click  . A copy of the color palettes is downloaded.

Creating a New Single Color Palette

These are the single colors that will be shared in a workbook for:

- records in Table and Record visualizations for the background, text, or shape
- visual members in Combination visualizations for the background or text

Light and medium single color palettes are provided in Panopticon Real Time, but you can also add new ones.

Steps:

1. On the *Single* section, click the **Add Palette**  icon.

The *New Single Palette* dialog displays.

2. Enter the *Title* then click  .
3. Click the **Color** box to display the *Color* dialog and set the palette color or enter the Hex color code.

4. Click  .

The new single color palette is added in the list (e.g., **Medium Yellow**). Note that it is already included and can be [modified](#), [duplicated](#), and [deleted](#).

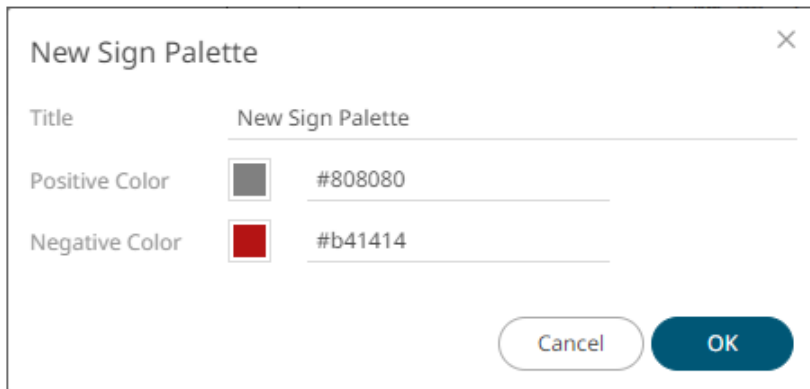

Single					
Include	Name				
<input checked="" type="checkbox"/>	Light Blue	<input type="radio"/>			
<input checked="" type="checkbox"/>	Light Gray	<input type="radio"/>			
<input checked="" type="checkbox"/>	Light Green	<input type="radio"/>			
<input checked="" type="checkbox"/>	Light Orange	<input type="radio"/>			
<input checked="" type="checkbox"/>	Light Red	<input type="radio"/>			
<input type="checkbox"/>	Medium Blue	<input checked="" type="radio"/>			
<input checked="" type="checkbox"/>	Medium Gray	<input type="radio"/>			
<input checked="" type="checkbox"/>	Medium Green	<input type="radio"/>			
<input checked="" type="checkbox"/>	Medium Orange	<input type="radio"/>			
<input checked="" type="checkbox"/>	Medium Red	<input type="radio"/>			
<input checked="" type="checkbox"/>	Medium Yellow	<input type="radio"/>			

Creating a New Sign Color Palette

The Sign color palette is used to signify the positive or negative values in numeric visual members.

Steps:

1. On the *Sign* section, click the **Add Palette**  icon.
The *New Sign Palette* dialog displays.

The dialog box titled "New Sign Palette" has a close button (X) in the top right corner. It contains the following fields:

- Title:** New Sign Palette
- Positive Color:** A gray color swatch followed by the hex code #808080.
- Negative Color:** A red color swatch followed by the hex code #b41414.

At the bottom right, there are two buttons: "Cancel" and "OK".

2. Enter the *Title* then click .
3. To set the *Positive Color* (default is **Gray**) and the *Negative Color* (default is **Red**), click the **Color** box to display the *Color* dialog and select the palette color or enter the Hex color code.

4. Click .

The new Sign color palette is added in the list (e.g., **Red-Green**). Note that it is already included and can be [modified](#), [duplicated](#), and [deleted](#).

Sign					
Include		Name			
<input checked="" type="checkbox"/>	Light Orange-Blue	<input type="radio"/>			
<input checked="" type="checkbox"/>	Light Orange-Green	<input type="radio"/>			
<input checked="" type="checkbox"/>	Light Red-Blue	<input type="radio"/>			
<input checked="" type="checkbox"/>	Light Red-Green	<input type="radio"/>			
<input checked="" type="checkbox"/>	Medium Orange-Blue	<input type="radio"/>			
<input checked="" type="checkbox"/>	Medium Orange-Green	<input type="radio"/>			
<input checked="" type="checkbox"/>	Medium Red-Blue	<input type="radio"/>			
<input checked="" type="checkbox"/>	Medium Red-Green	<input type="radio"/>			
<input type="checkbox"/>	Red-Gray	<input checked="" type="radio"/>			
<input checked="" type="checkbox"/>	Red-Green	<input type="radio"/>			

Creating a New Text Color Palette

The configuration pane for the *Color* variable changes depending on the column data type.

In the Web Authoring, when a text column is added to the *Color* variable, the configuration pane displays the color associated with each categorical item, as specified with a default color palette (e.g., **Twenty Eight Colors**).

Steps:

1. On the *Text* section, click the **New +** icon.

The *Next Text Palette* dialog displays.

New Text Palette	
Title	New Text Palette
No. of Colors	28
Other	
	#a5a5a5
	#2580bd
	#ce3133
	#3cb03c
	#e27631
	#c773d1
	#d4bb27
	#4fbdbe
	#69a0d2
	#ea6258
	#757575

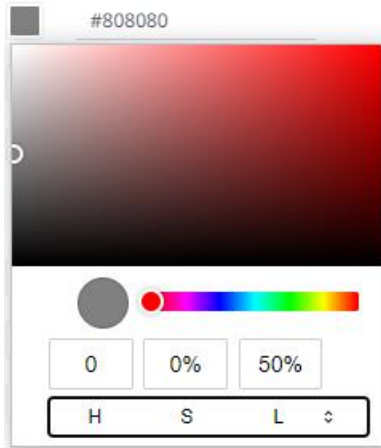

2. Enter the *Title* then click .
3. Select the *Number of Colors* in the drop-down list. Default is **28** colors.
The *Other* list is updated accordingly.
4. To set the colors:
 - click the corresponding *Color* box to display the *Color* dialog to:

- ◆ select the color, or
- ◆ click  to enter the values for RGB

for HSL

for the Hex color code

- or enter the *Hex* color code

5. Click  .

The new text color palette is added in the list (e.g., **Sixteen Colors**). Note that it can be [deleted](#).

Text					
Include	Name				
<input checked="" type="checkbox"/>	Coffee Bean	<input type="radio"/>			
<input checked="" type="checkbox"/>	Fourteen Colors	<input type="radio"/>			
<input checked="" type="checkbox"/>	Panopticon BI	<input type="radio"/>			
<input checked="" type="checkbox"/>	Seven Light Colors	<input type="radio"/>			
<input checked="" type="checkbox"/>	Seven Standard Colors	<input type="radio"/>			
<input checked="" type="checkbox"/>	Sixteen Colors	<input type="radio"/>			
<input checked="" type="checkbox"/>	Spectral	<input type="radio"/>			
<input checked="" type="checkbox"/>	Sunshine	<input type="radio"/>			
<input checked="" type="checkbox"/>	Twenty Eight Colors	<input checked="" type="radio"/>			
<input type="checkbox"/>	Twenty Eight Colors Print	<input type="radio"/>			
<input checked="" type="checkbox"/>	Vintage	<input type="radio"/>			

Creating a Sequential or Diverging Numeric Color Palette

Panopticon visualizations support two types of Numeric Color Palettes: Sequential and Diverging.

Sequential Color Palettes

Sequential palettes use a two-color gradient between a minimum and a maximum value. Numeric columns containing only positive values default to a Sequential Palette using the **White-Blue** color palette.

In this case the range *Mid* point is disabled, and the *Min* and *Max* points are populated with defaults from the data set.

Diverging Color Palettes

Diverging Palettes use a three-color gradient between a minimum, middle and a maximum value. Numeric columns containing both positive and negative values default to the Diverging Palette with the **Red White Blue** color palette selected.

Diverging Palettes use the **Range Midpoint**. The *Min*, *Mid* and *Max* points are populated with defaults from the data set.

To create a new sequential numeric color palette:

1. On the *Sequential* section, click the **New** icon.

The *New Sequential Palette* dialog displays.

2. Enter the *Title* and click ✓ .
3. Select the *Number of Colors* in the drop-down list. Default is **4** colors.
The number of colors from *Min* to *Max* is updated accordingly.
4. Set the *Outliers*, *Min*, and *Max* colors. Refer to step 4 of [Creating a New Text Color Palette](#) for more information.

5. Click .
The new sequential numeric color palette is added in the list and can be [deleted](#) (e.g., **Green-Red**).

Sequential					
Include	Name				
<input checked="" type="checkbox"/>	Gray	<input type="radio"/>			
<input checked="" type="checkbox"/>	Green-Red	<input type="radio"/>			
<input checked="" type="checkbox"/>	Purple-Orange	<input type="radio"/>			
<input checked="" type="checkbox"/>	White-Blue	<input checked="" type="radio"/>			
<input type="checkbox"/>	White-Blue-Print	<input type="radio"/>			
<input checked="" type="checkbox"/>	White-Green	<input type="radio"/>			
<input checked="" type="checkbox"/>	White-Orange	<input type="radio"/>			
<input checked="" type="checkbox"/>	White-Red	<input type="radio"/>			
<input type="checkbox"/>	White-Red-Print	<input type="radio"/>			
<input checked="" type="checkbox"/>	Yellow-Red	<input type="radio"/>			

To create a new diverging numeric color palette:

1. On the *Diverging* section, click the **New** icon.

The *New Diverging Palette* dialog displays.

Category	Color	Hex Code
Title	New Diverging Palette	
No. of Colors	7	
Outlier		#ff6400
Min		#b41414
		#e13232
		#f7aa9b
Mid		#f7f7f7
		#a0c8dc
		#468cc8
Max		#0064b4
Outlier		#00c8ff

2. Enter the *Title* and click  .
3. Select the *Number of Colors* in the drop-down list. Default is **7** colors.
The number of colors from *Min*, *Mid*, to *Max* is updated accordingly.
4. Set the *Outliers*, *Min*, *Mid*, and *Max* colors. Refer to step 4 of [Creating a New Text Color Palette](#) for more information.

5. Click  .
The new diverging numeric color palette is added in the list and can be [deleted](#) (e.g., **Yellow-White-Red**).

Diverging

+

Include	Name				
<input type="checkbox"/>	Brown-Gray-Petrol	<input type="radio"/>			
<input checked="" type="checkbox"/>	Brown-White-Petrol	<input type="radio"/>			
<input type="checkbox"/>	Orange-Gray-Blue	<input type="radio"/>			
<input type="checkbox"/>	Orange-Gray-Green	<input type="radio"/>			
<input checked="" type="checkbox"/>	Orange-White-Blue	<input type="radio"/>			
<input checked="" type="checkbox"/>	Orange-White-Green	<input type="radio"/>			
<input checked="" type="checkbox"/>	Purple-White-Turquoise	<input type="radio"/>			
<input type="checkbox"/>	Red-Black-Blue	<input type="radio"/>

<input type="checkbox"/>	Red-Gray-Green	<input type="radio"/>			
<input checked="" type="checkbox"/>	Red-White-Blue	<input checked="" type="radio"/>			
<input type="checkbox"/>	Red-White-Blue-Print	<input type="radio"/>			
<input checked="" type="checkbox"/>	Red-White-Green	<input type="radio"/>			
<input type="checkbox"/>	Red-White-Green-Print	<input type="radio"/>			
<input checked="" type="checkbox"/>	Red-Yellow-Green	<input type="radio"/>			
<input type="checkbox"/>	Red-Yellow-Green-Print	<input type="radio"/>			
<input checked="" type="checkbox"/>	Yellow-White-Red	<input type="radio"/>			

Modifying Color Palettes

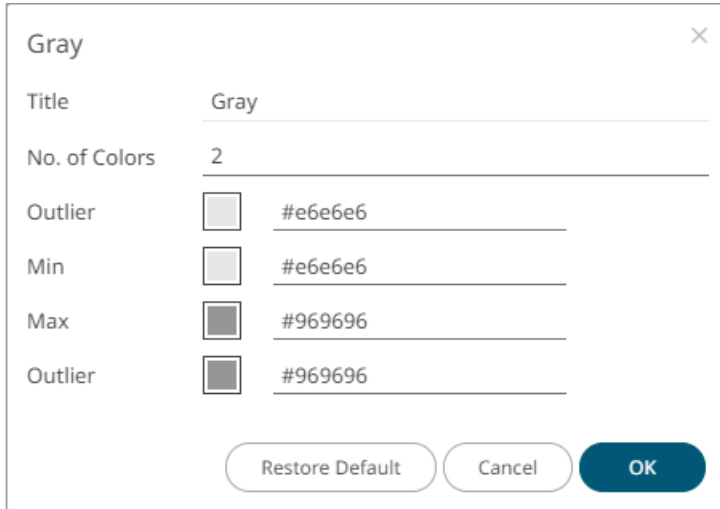

Any of the included or checked color palettes can be modified.

NOTE

- For the selected default color palette, only the *Number of Colors* and assigned colors can be modified.
- Color palettes that are not selected cannot be modified.

Steps:

1. Click the **Edit**  icon of an included or checked color palette.
The corresponding dialog box displays.

Field	Value
Title	Gray
No. of Colors	2
Outlier	 #e6e6e6
Min	 #e6e6e6
Max	 #969696
Outlier	 #969696

2. Modify the *Title*, *Number of Colors*, and assigned colors.

3. Click  to commit the changes or  to revert to the original settings.

Creating a Duplicate of a Color Palette

Click the **Duplicate**  icon of a color palette. A copy of the color palette is added in the list (e.g., **Seven Light Colors 1**).

Text +

Include	Name				
<input checked="" type="checkbox"/>	Coffee Bean	<input type="radio"/>			
<input checked="" type="checkbox"/>	Fourteen Colors	<input type="radio"/>			
<input checked="" type="checkbox"/>	Panopticon BI	<input type="radio"/>			
<input checked="" type="checkbox"/>	Seven Light Colors	<input type="radio"/>			
<input checked="" type="checkbox"/>	Seven Light Colors 1	<input type="radio"/>			
<input checked="" type="checkbox"/>	Seven Standard Colors	<input type="radio"/>			
<input checked="" type="checkbox"/>	Sixteen Colors	<input type="radio"/>			
<input checked="" type="checkbox"/>	Spectral	<input type="radio"/>			
<input checked="" type="checkbox"/>	Sunshine	<input type="radio"/>			
<input checked="" type="checkbox"/>	Twenty Eight Colors	<input checked="" type="radio"/>			
<input type="checkbox"/>	Twenty Eight Colors Print	<input type="radio"/>			
<input checked="" type="checkbox"/>	Vintage	<input type="radio"/>			

You can opt to [modify](#) the settings.

Deleting Color Palettes

New or duplicate color palettes can be deleted. Click the **Delete**  icon to remove the color palette in the list.

SHAPE PALETTES

Shape palettes that can be used with the workbook theme can be [created](#), [uploaded](#), [downloaded](#), [modified](#), [duplicated](#), rearranged, or [deleted](#) on the *Shape Palettes* page.

NOTE Panopticon is shipped with two shape palettes (**Default Shape Palette** and **Arial**).

Creating a New Shape Palette

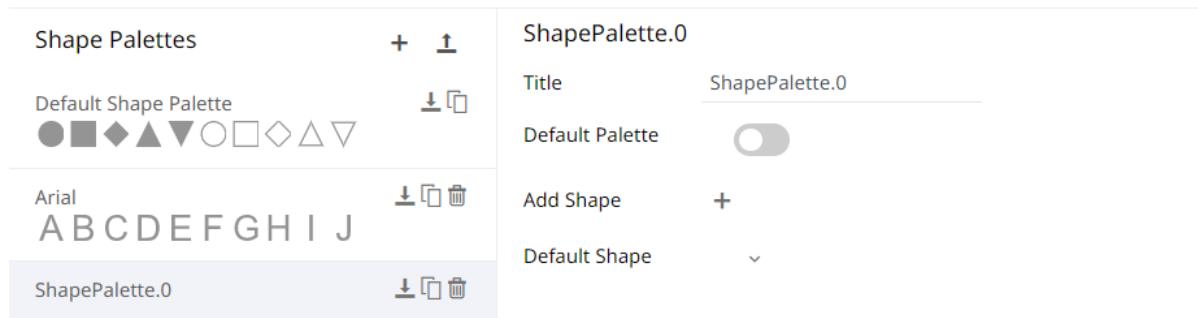

Steps:

1. Click **Add Palette**  .
A new shape palette displays (i.e., **ShapePalette.0**).

2. Click *ShapePalette.<Number>*.

The page changes to allow the definition of the new shape palette.

3. Enter the shape palette *Title* and click ✓ .
4. To make this shape palette the default for the workbook theme, tap the **Default Palette** slider to turn it on.

NOTE The default shape palette cannot be deleted.

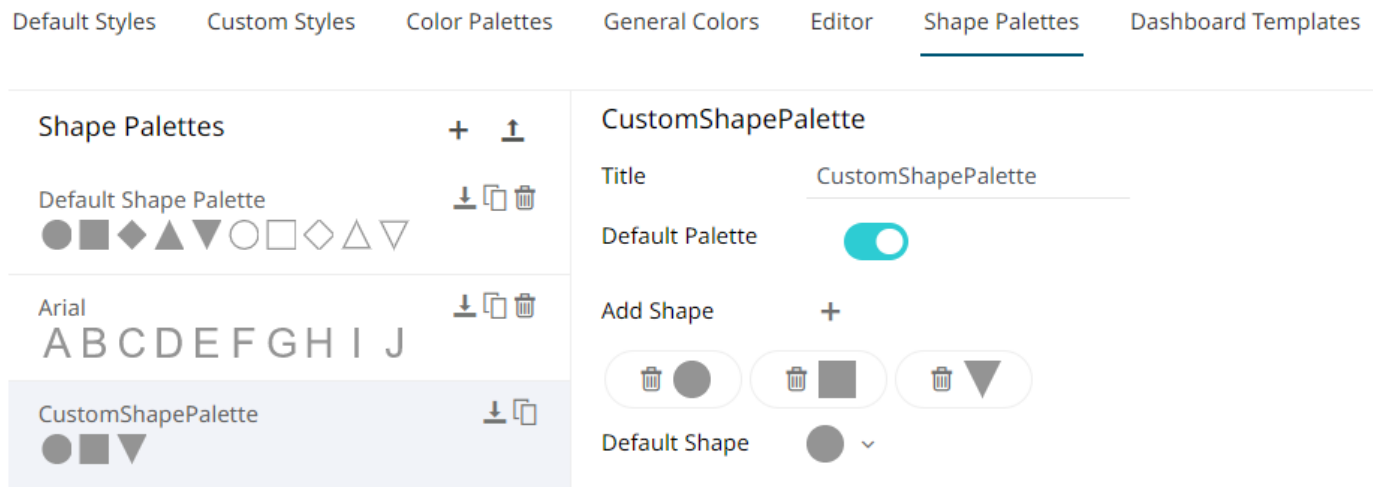

5. To add the shapes, click + .

You can either:

- click on a shape.
- click . Select one or more SVG files in the *Open* dialog box that displays.

The added shapes are displayed.

To delete a shape, click its corresponding **Delete**  icon.

6. Select the *Default Shape* in the drop-down list.

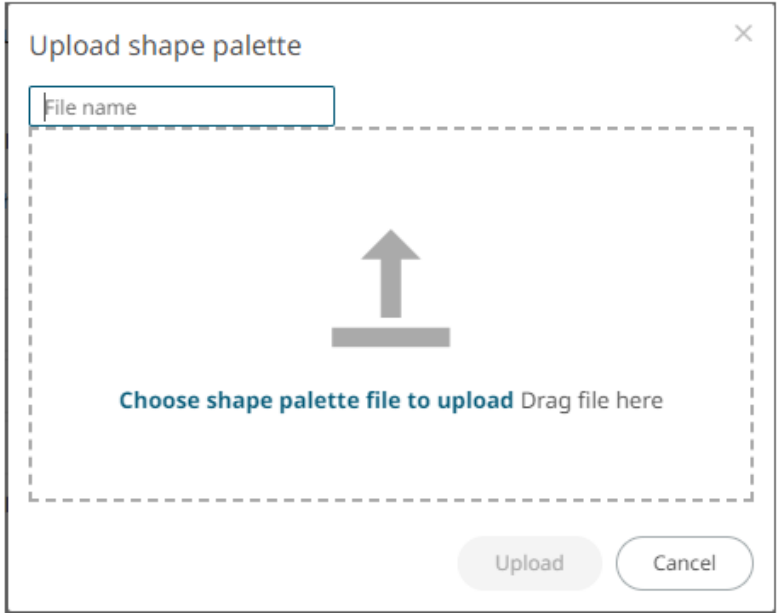

7. Click the **Save** .

Uploading a Shape Palette

Users can upload their own shape palettes.

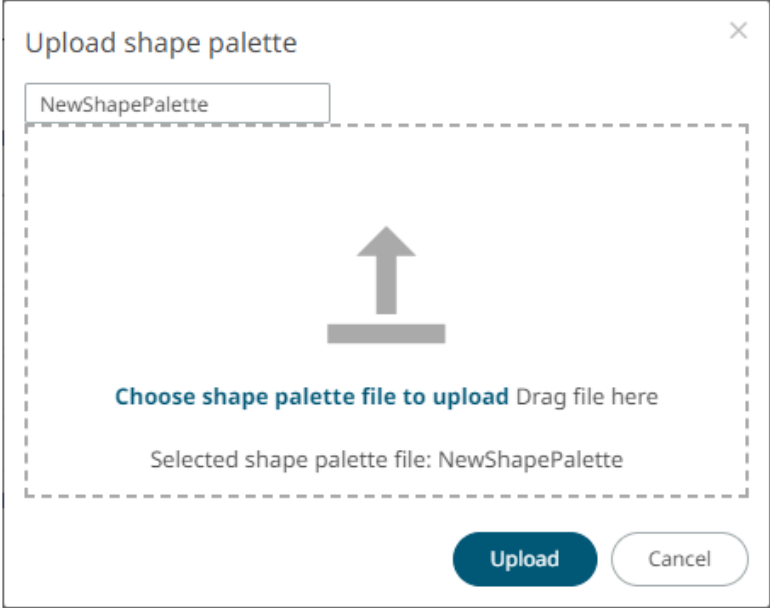

Steps:

1. On the *Shape Palettes* pane, click .
The *Upload Shape Palette* dialog displays.

2. To upload a shape palette, either:
- drag the file from your desktop and drop on the dialog, or
 - click **Choose shape palette file to upload** and then browse and select one on the *Open* dialog that displays.

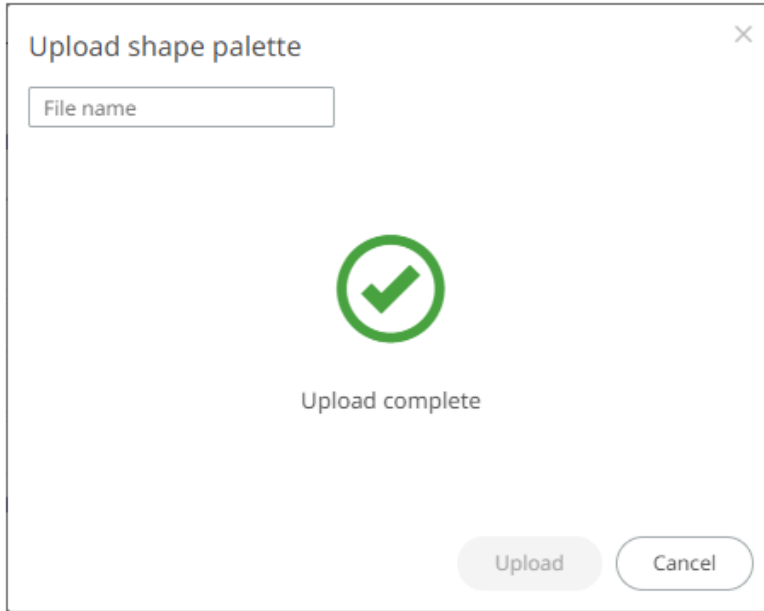

The name of the shape palette is displayed on the uploaded shape palette area and in the *Name* box.

You can opt to rename the uploaded shape palette.

3. Click .

A notification displays once the file is uploaded.

Click  to close the dialog. The uploaded shape palette is added in the list.

Downloading a Shape Palette

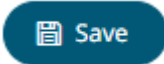

You can download a copy of any of the shape palettes.

Click the **Download**  icon of a shape palette.

Modifying Shape Palettes

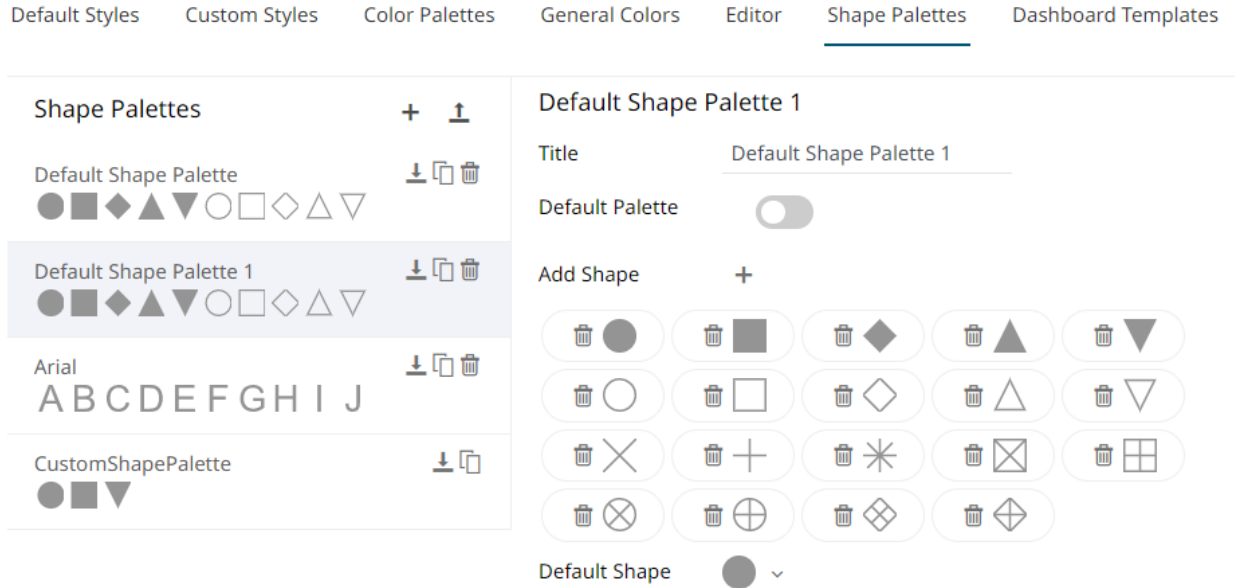

Any of the shape palettes can be modified.

Steps:

1. Click on a shape palette to display its settings.
2. You can modify the following properties:
 - Title
 - Default Palette. Tap to enable or disable.
 - Add or delete shapes
 - Default Shape
3. Click the **Save**  icon to save the changes.

Creating a Duplicate of a Shape Palette

Click the **Duplicate**  icon of a shape palette. A copy of the shape palette is added in the list (e.g., **Default Shape Palette 1**).

You can opt to [modify](#) the settings.

Rearranging Shape Palettes

The order of the shape palettes can be rearranged.

Steps:

1. Click on a shape palette you want to move.

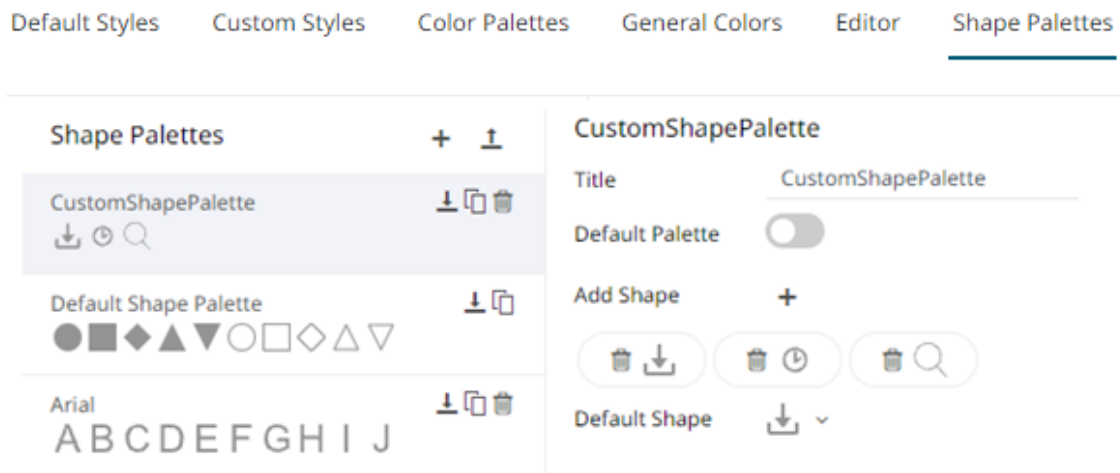

The **Hand Hover**  icon displays along with the blue marker before or after a shape palette where you can drop the item.

2. Drag and drop the shape palette to the desired position.

← Dark

← Dark

3. Click the **Save**  icon to save the changes.

Deleting Shape Palettes

Any shape palette can be deleted except the default. Click the **Delete**  icon to remove the shape palette in the list.

[15] PCLI: COMMAND UTILITIES FOR PANOPTICON REAL TIME

Panopticon Real Time is supplied with a command line utility `PCLI.jar`.

After extracting all of the contents of the `pcli` archive (`pcli-java.zip`), it is necessary to copy all of the JAR files from `...\apache-tomcat\webapps\panopticon\WEB-INF\lib\` to `...\pcli-java\lib\`.

NOTE Ensure to overwrite any existing files when copying all of the JAR files from `...\apache-tomcat\webapps\panopticon\WEB-INF\lib\` to `...\pcli-java\lib\`.

This supports the following:

clearcache	Clears the cache on a Panopticon Real Time.
plugins	Troubleshoot the plugins that this program utilizes.
publish	Publishes a workbook to a server or folder .
version	Prints program (and optionally server) version and exits.
help	Use 'help <command>' to get help on a specific command.
upgrade	Upgrades specified workbook to the newest version.
schemify	Updates workbook data tables with missing schema information.
exportdatasource	Export workbook data sources.
convertpermissions	Converts old permission files to the new format.
migratedatabasetojdbc	Migrates all usages of the Database connector to JDBC connector in the given workbook/directory of workbooks.
mockdata	Updates workbook data tables with mock data based on the stored schema.
encrypt	Allows encryption of either a single text or an entire <code>.properties</code> file.
decrypt	Allows decryption of either a single text input or an encrypted <code>.properties</code> file.

Summary help is displayed through: `[pcli-java folder]>java -jar pcli.jar help`

More detailed help is displayed through: `[pcli-java folder]>java -jar pcli.jar help [command]`

Clearcache

Clears the cache in Panopticon Real Time.

Option	Description
-w, --workbook	Workbook name. Syntax example: java -jar pcl.jar clearcache -w "workbook" -u "http://username:password@host:port/app_name/"
-d, --datatable	Datatable name. Syntax example: java -jar pcl.jar clearcache -w "workbook" -d "datatable" -u "http://username:password@host:port/app_name/"
-u, --url	URL to Panopticon Real Time, syntax: java -jar pcl.jar clearcache -u http://username:password@host:port/app_name/.

Command example: java -jar pcl.jar clearcache -w "How To Actions" -d "StocksTimeSeriesFilteredTimeParameters" -u "http://username:password123@localhost:8080/panopticon"

Plugins

Troubleshoot the plugins that this program utilizes.

Option	Description
-v, --verbose	Print all information normally traced by the plugin manager.

Publish

You can either publish a workbook to a Panopticon Real Time or to a specific folder.

Publishing a Workbook to Panopticon Real Time

Publishes a workbook to Panopticon Real Time.

Option	Description
-f, --force	Overwrite existing workbook on server. Syntax example: java -jar pcl.jar publish -w "workbook" -d -u "http://username:password@host:port/app_name/" -n "name" -f
-w, --workbook	The workbook file to publish.

	Syntax example: <code>java -jar pcli.jar publish -w "workbook" -u "http://username:password@host:port/app_name/"</code>
<code>-d, --dataFiles</code>	Find and upload data files used by workbook.
<code>-u, --url</code>	URL to Panopticon Real Time, syntax: <code>java -jar pcli.jar publish -w "workbook" -d -u "http://username:password@host:port/app_name/"</code>
<code>-n, --name</code>	Publish workbook with a different name. Syntax example: <code>java -jar pcli.jar publish -w "workbook" -d -u "http://username:password@host:port/app_name/" -n "name"</code>
<code>--local</code>	Publishes workbook by file copy, instead of HTTP, for use when server exists on the local system. Specifies target file location path including file name. If the server is running, the application pool must be recycled after publication.
<code>-cp</code>	Java classpath. Syntax example: <code>java -cp pcli.jar; [plugin dir]/* com.panopticon.dashboards.pcli.Pcli publish -w "workbook" -u "http://username:password@host:port/app_name/"</code>

Command example: `java -cp pcli.jar;lib/* com.panopticon.dashboards.pcli.Pcli publish -w "How To Actions.exw" -d -u "http://username:password123@localhost:8080/panopticon" -n "Published by pcli" -f`

Publishing a Workbook to a Folder

Publishes a workbook to a specific folder.

Option	Description
<code>-w, --workbook</code>	The workbook file to publish. Syntax example: <code>java -jar pcli.jar publish -w "workbook" -u "http://username:password@host:port/app_name/"</code>
<code>-u, --url</code>	URL to Panopticon Real Time, syntax: <code>java -jar pcli.jar publish -w "workbook" -d -u "http://username:password@host:port/app_name/"</code> NOTE: The username in the <code>-u</code> command must have permission to the folder. Just being in the list of Administrators is not enough.
<code>-n, --name</code>	Publish workbook to a folder on the server with a different name. Syntax example: <code>java -jar pcli.jar publish -w "workbook" -d -u "http://username:password@host:port/app_name/" -n "folder\name"</code>
<code>-d, --dataFiles</code>	Find and upload data files used by workbook.

Command example: `java -jar pcli.jar publish -w "E:\Temp\How to Actons.exw" -u "http://username:password123@localhost:8080/panopticon" -n "test\How to Actions.exw"`

Publishing a Workbook Folder to Panopticon Real Time

Publishes a workbook folder to Panopticon Real Time.

Option	Description
-tf, --targetFolder	The target folder to which workbooks will be published. Use -r to publish all workbooks to the ROOT folder. This is only applicable with -wf Syntax example: java -jar pclj.jar publish -u " http://username:password@host:port/app_name/ " -wf "folder containing workbooks" -tf "server folder name" -r
-r, --root	Publish workbooks to the ROOT folder. This is only applicable with -wf Syntax example: java -jar pclj.jar publish -u " http://username:password@host:port/app_name/ " -wf "folder containing workbooks" -tf "server folder name" -r "default or root folder"
-u, --url	URL to Panopticon Real Time, syntax: java -jar pclj.jar publish -w "workbook" -u " http://username:password@host:port/app_name/ "
-wf, --workbookFolder	The workbook folder from which workbooks will be picked to publish. Use -w to publish single workbook. Syntax example: java -jar pclj.jar publish -u " http://username:password@host:port/app_name/ " -wf "folder containing workbooks" -tf "server folder name" -r

Command example: java -cp pclj.jar publish "<http://username:password123@localhost:8080/panopticon/>" -wf "C:\Serverdata\Data" -tf "c:\Streamsdata\Data" -r

Version

Prints program (and optionally server) version and exits.

Option	Description
-u, --url	URL to Panopticon Real Time, syntax: java -jar pclj.jar version -u " http://username:password@host:port/app_name/ "

Command example: java -jar pclj.jar version -u "<http://username:password123@localhost:8080/panopticon/>"

Help

Lists all commands or options for a single command.

Command example: java -jar pclj.jar help access

Upgrade

Upgrades specified workbook to the newest version.

Option	Description
-w, --workbook	Workbook path to upgrade. Syntax example: <code>java -jar pcl.jar upgrade -w workbook.exw</code>
-o, --output	Output workbook path. Syntax example: <code>java -jar pcl.jar upgrade -w workbook.exw -o workbook1.exw</code>

Schemify

Updates workbook data tables with missing schema information.

Option	Description
--dd, --data-directory	Data directory path. Syntax example: <code>java -jar pcl.jar schemify -wd "workbook directory" -od "output directory" --dd "C:\Users\Public\Documents\Datawatch Desktop\Data"</code>
-D	Default parameter. This can be supplied either by using: -dp command to pass the path to Parameters.json which is the default parameter file Syntax example: <code>java -jar pcl.jar schemify -w "workbook path" -o "output path" -l "license file path" -dp "default parameters file"</code> -D switch to specify parameters Syntax example: <code>java -jar pcl.jar schemify -w "workbook path" -o "output path" -l "license file path" -D "parameter=value"</code>
-od, --output-directory	Output directory path. Syntax example: <code>java -jar pcl.jar schemify -wd "workbook directory" -od "C:\Users\Public\Documents\Datawatch Desktop\NewWorkbooks" --dd "data directory"</code>
-w, --workbook	Workbook to schemify.
-l, --license-file	License file path. Syntax example: <code>java -jar pcl.jar schemify -wd "workbook path" -o "output path" -l "C:\vizserverdata\PanopticonLicense.xml"</code>
-wd, --workbook-directory	Directory of the workbooks to schemify.
-o, --output	Output path.

Exportdatasource

Export workbook data source.

Option	Description
-dd, --data-directory	Data directory path.
-od, --output-directory	Output directory path.
-w, --workbook	Export data sources of workbook.
-l, --license-file	License file path.
-wd, --workbook-directory	Directory of workbooks.

Command example: `java -jar pcl.jar exportdatasource -l "E:\projects\Dashboards.NET\PanopticonLicense.xml" -w "E:\workbooks\exportdb.exw" -dd "E:\Serverdata\export" -od "E:\Streamsdata\export" -wd "E:\workbooks"`

Convertpermissions

Takes an old `Workbooks` folder and scans it for `GroupAccessPermissions.xml` files, collects them, and outputs a single file that can then be consumed by the server.

Option	Description
-wf, - workbookFolder	Path to old <code>Workbooks</code> folder, defaults to the current folder.
-o, - outputFile	Path to file where the result will be output. Default is stdout .
-wa, - writersAdmin	If users that had write permission on the old server should additionally get admin permission on the new server, defaults to not. The old server only had read and write , the new one has read , write , and admin .
-tf, - targetFolder	Path to subfolder on target server where you intend to import the workbooks, if not the root folder.

NOTE

- Special treatment of empty input folders:

If a workbook folder did not have a `GroupAccessPermissions.xml` file, the old server would treat it as if the "Everyone" group had both read and write access to it. This is made explicit in the PCLI verb, which adds this permission to the output.

For example:

```
pcli convertpermissions -wf
/appdata17/Workbooks/ -o perms.json -wa -tf
/migrated/
```

This creates `perms.json` which can then be used to restore the

permissions from the old server on the new server if you import the old workbooks into the “migrated” workbook folder.

- See also the [Panopticon.properties](#) parameter [repository.startup.apply.permissions.path](#).

MigrateDatabaseToJDBC

Migrates all usages of the Database connector to JDBC connector to enable editing in the Web Client.

Option	Description
-w, - workbook	Full path of workbook to migrate.
-o, --output	Output path. Can be used together with the '-w' option, when a new name to migrated workbook is needed. Output directory should exist.
-od, --output-directory	Output directory path. Output directory should exist.
-wd, --workbook-directory	Directory of workbooks to upgrade.

Command example: `java -jar pcli.jar migratedatabasetojdbc -w "E:\Workbooks\Database.exw" -o "E:\MigratedWorkbooks\JDBC.exw"`

Mockdata

Updates workbook data tables with mock data based on the stored schema.

Option	Description
-w, - workbook	Workbook to mock the data table data.
-o, --output	Output path.

Command example: `java -jar pcli.jar mockdata -w "z Custom Index - v4 (2).exw" -o MockData.exw Workbooks\z Custom Index - v4: saved updated workbook to MockData.exw`

Encrypt

Allows encryption of either a single text or an entire `.properties` file.

Option	Description
<code>-t, --text</code>	Text to encrypt.
<code>-p, --properties</code>	Input <code>Panopticon.properties</code> file.
<code>-o, --output</code>	Output property file.
<code>-f, --filter</code>	Property filter regex.

Command examples:

`.properties` file

```
java -jar pcli.jar encrypt -p
/url/share/vizserverdata/Panopticon.properties -o Define.properties -f
.*password
```

text string

```
java -jar pcli.jar encrypt -t passwordName
```

Decrypt

Allows decryption of either a single text input or an encrypted `.properties` file.

Option	Description
<code>-t, --text</code>	Text to encrypt.
<code>-p, --properties</code>	Input <code>Panopticon.properties</code> file.

Command examples:

`.properties` file

```
java -jar pcli.jar decrypt -p /usr/share/vizserverdata/Define.properties
```

text string

```
java -jar pcli.jar decrypt -t a7DUF0EONaFBAqNI2W4NoA==
```

[16] REST INTERFACE

DISCLAIMER

As part of the deprecation of Desktop Designer and related legacy visualization- and data pipelines, we have unfortunately had to retire a set of previously documented REST service endpoints. The endpoints below will no longer be available in the product:

- GET `media/image/dashboard`
- GET `media/image/dashboard/part`

All Panopticon APIs should be considered proprietary, internal and subject to change. Going forward, all REST endpoints will be classified into private and publicly supported APIs. Please let us know if your implementation relies on REST API, to ensure that the functionality is made available in future public API.

API

Panopticon Real Time exposes services through a REST API. You can use this for scripting and automation, and other tasks like review query statistics and monitor performance.

NOTE

You can use PCLI for some common tasks like upload a workbook and example workbooks to view server performance too.

There are two API groups: the public API which is being built out starting in version 2022.1, and the legacy API. Going forward, new services will only be added to the public API, and old services may migrate there. Other than that, the main differences are:

The public API	The legacy API
<ul style="list-style-type: none">• Is officially supported by Altair	<ul style="list-style-type: none">• Is "unsupported" in the sense that we cannot guarantee that an endpoint will stay unchanged or even remain between releases
<ul style="list-style-type: none">• Will evolve predictably in the future	
<ul style="list-style-type: none">• Is designed specifically for REST	<ul style="list-style-type: none">• Was designed when the server had both REST and SOAP APIs, so is a bit cumbersome from a REST perspective
<ul style="list-style-type: none">• Has endpoints that begin with <code>/api</code>, e.g., http://localhost:8080/panopticon/api/user/data/profile	<ul style="list-style-type: none">• Has endpoints that begin with <code>/server/rest</code>
<ul style="list-style-type: none">• Has documentation in OpenAPI 3 (see https://openapis.org) at <code>/v3/api-docs/public</code>, e.g., http://localhost:8080/panopticon/v3/api-docs/public	<ul style="list-style-type: none">• Has documentation in OpenAPI 2 (see https://swagger.io/specification/v2/) at <code>/v2/api-docs</code>

- | | |
|---|--|
| <ul style="list-style-type: none"> • Has a Swagger UI (see https://swagger.io/tools/swagger-ui/) at /swagger-ui.html, e.g., http://localhost:8080/panopticon/swagger-ui.html | <ul style="list-style-type: none"> • Has a Swagger UI at /swagger-ui.html, but you need to select the legacy definition in the top bar |
|---|--|

NOTE

The API documentation endpoints and Swagger UI are disabled by default. You need to set `documentation.enabled=true` in [Panopticon.properties](#) (and restart the server) to use them. The REST endpoints and services themselves are always enabled. You should never enable the documentation on a production server.

EXPORT DATA

CSV

Panopticon Real Time provides the functionality to export data from a visualization to a CSV file.

Use the following URL to download the CSV file from the Server:

- ❑ URL: `http://[server]/[path]/server/rest/media/data/dashboard/part`

Each URL has the following properties:

- ❑ Mandatory arguments
 - **Workbook** – Workbook name without an extension.
 - **Dashboard** – Dashboard name in the workbook.
 - **Part** – The visualization part ID

The following examples show how to export the data of a visualization from a local server. For these examples, we have used the example workbook **How To Actions**.

- ❑ Export data as a CSV file
 - **Syntax:** `http://[server]/[path]/server/rest/media/data/dashboard/part?workbook={Workbook name}&dashboard={Dashboard name}&part={Visualization part id}`
 - **Example:**
`http://localhost:8080/panopticon/server/rest/media/data/dashboard/part?workbook=How+To+Actions&dashboard=Data+Entry&part=visualization.Treemap1`

Dashboard Parameters

The CSV file can be generated based on the workbook data table parameters. The parameter and its values can be specified to determine the context of the exported data.

Syntax:

```
http://[server]/[path]/server/rest/media/data/dashboard/part?workbook={Workbook name}&dashboard={Dashboard name}&part={Visualization part id}&{dashboardParameterName1=value1}&{dashboardParameterName2=value2}
```

Adding Region=Europe and Industry=Financials parameters

Example:

```
http://localhost:8080/panopticon/server/rest/media/data/dashboard/part?workbook=How+To+Actions&dashboard=Scatter+of+Filtered+Universe&part=visualization.ScatterPlot1&Region=Europe&Industry=Financials
```

Adding Region=Asia Pacific, or Region=Europe and Industry= Financials parameters produces a CSV file that is focused on Asia Pacific & European Financials. In this case the Region parameter is repeated for each of the supplied regions.

Example:

```
http://localhost:8080/panopticon/server/rest/media/data/dashboard/part?workbook=How+To+Actions&dashboard=Scatter+of+Filtered+Universe&part=visualization.ScatterPlot1&Region=Asia+Pacific&Region=Europe&Industry=Financials
```

PDF

Panopticon Real Time provides the functionality to generate and download PDFs. Use the following URL to download PDFs from the server:

❑ URL: `http://[server]/panopticon/server/rest/media/pdf`

The URL can be accessed through scheduled batch tasks to retrieve and process generated PDFs. (e.g., email to predefined mailing list).

Each URL has the following properties:

- ❑ Mandatory arguments
 - **Workbook** – Workbook name without an extension.
- ❑ Optional arguments
 - **Dashboard** – Dashboard name in the workbook.
 - **HideScrollbars** – Show/Hide the visualization scrollbar in the PDF. Possible values are true/false. The default value is true.
 - **EnablePagination** – Enable pagination in the PDF. Possible values are true/false. The default value is **true**.

The following examples show how to export a PDF from a local server. For these examples, we have used the example workbook **How To Actions**.

- ❑ Generate PDF report of the entire workbook
 - **Syntax:** `http://[server]/[path]/server/rest/media/pdf?workbook={Workbook name}`
 - **Example:** `http://localhost:8080/panopticon/server/rest/media/pdf?workbook=How+To+Actions`
- ❑ Generate PDF report of the entire workbook in a folder
 - **Syntax:** `http://[server]/[path]/server/rest/media/pdf?workbook={Folder name%5CWorkbook name}`
 - **Example:**
`http://localhost:8080/panopticon/server/rest/media/pdf?workbook=my+folder%5CHow+To+Actions`

NOTE

When the workbook name specifies any folder or subfolders, the path delimiter must be backslash (URL-encoded as %5C) and not forward slash (URL-encoded as %2F).

- ❑ Generate PDF report of a single dashboard in the workbook
 - **Syntax:** `http://[server]/[path]/server/rest/media/pdf?workbook={Workbook name}&dashboard={Dashboard name}`
 - **Example:**
`http://localhost:8080/panopticon/server/rest/media/pdf?workbook=How+To+Actions&dashboard=How+To+Actions`
 - **Example (Multiple dashboards):**
`http://localhost:8080/panopticon/server/rest/media/pdf?workbook=How+To+Actions&dashboard=How+To+Actions&dashboard=Data+Entry`
- ❑ Hide scrollbars from visualizations in the PDF
 - **Syntax:** `http://[server]/[path]/server/rest/media/pdf?workbook={Workbook name}&hideScrollbars={true/false}`
 - **Example:**
`http://localhost:8080/panopticon/server/rest/media/pdf?workbook=How+To+Actions&hideScrollbars=true`
- ❑ Enable or disable pagination of visualizations with vertical scrollbars in the PDF report
 - **Syntax:** `http://[server]/[path]/server/rest/media/pdf?workbook={Workbook name}&enablePagination={true/false}`
 - **Example:**
`http://localhost:8080/panopticon/server/rest/media/pdf?workbook=How+To+Actions&enablePagination=true`

Dashboard Parameters

The PDF report can be generated based on the workbook data table parameters. The parameter and its values can be specified to determine the context of the generated PDF report.

Syntax: `http://[server]/[path]/server/rest/media/pdf?workbook={Workbook name}&{dashboardParameterName1=value1}&{dashboardParameterName2=value2}`

Adding `Region=Europe` and `Industry=Financials` parameters

Example:

`http://localhost:8080/panopticon/server/rest/media/pdf?workbook=How+To+Actions&dashboard=Scatter+of+Filtered+Universe&Region=Europe&Industry=Financials`

Adding `Region=Asia Pacific`, or `Region=Europe` and `Industry=Financials` parameters produces an output PDF that is focused on Asia Pacific & European Financials. In this case the `Region` parameter is repeated for each of the supplied regions.

Example:

`http://localhost:8080/panopticon/server/rest/media/pdf?workbook=How+To+Actions&dashboard=Scatter+of+Filtered+Universe&Region=Asia+Pacific&Region=Europe&Industry=Financials`

Authentication

In order to generate certain workbooks, the user might need to be authenticated. The user will be prompted with a login window if the user tries to export a PDF from a web browser. The user can also send the credentials via a header to be authenticated. This could be necessary if the user is using commands like `wget` to invoke the server to generate PDFs.

The credentials are sent as basic authorization. The user provides the credentials in the **Authorization** header. The value is formatted in the following way: `Basic username:password`. Please note that the username and password must be Base64 encoded. Example: `MyUsername:MyPassword = TX1Vc2VybmFtZTpNeVBhc3N3b3Jk`

Wget example: `wget -O "Output.pdf" --header="Authorization: Basic TX1Vc2VybmFtZTpNeVBhc3N3b3Jk" "http://localhost:8080/panopticon/server/rest/media/pdf?workbook=How+To+Actions"`

The PDF generator supports the following authentication mechanisms:

- BASIC
- LDAP
- Filter authentication
- Header authentication
- Windows authentication

Excel Workbook

Panopticon Real Time provides the functionality to export a Panopticon workbook as an Excel workbook. All of the dashboards in the Panopticon workbook will be inserted into their own corresponding Excel sheet. In addition, all of the visualizations in the dashboard will be exported as a PNG image and inserted into an Excel sheet.

The images will be laid out as visualizations on the dashboard. However, the table visualizations will not be exported as images. The visualization tables will instead be exported as Excel tables. The Excel table will always be laid out under all of the exported visualization images.

Please note that only one table will be exported for each dashboard.

Use the following URL to download the Excel workbook from Panopticon Real Time:

- URL: `http://[server]/[path]/server/rest/media/excel`

Each URL has the following properties:

- Mandatory arguments
 - **Workbook** – Workbook name without an extension.
- Optional arguments
 - **Dashboard** – Dashboard name(s) in the Panopticon workbook. All of the dashboards will be exported if no dashboard names are provided. The dashboard argument can be used multiple times depending on how many dashboards should be exported.
 - **Width** – The width of the exported dashboards. The default value is **1024px**.
 - **Height** – The height of the exported dashboards. The default value is **768px**.
 - **Style** – The Excel table style of an exported table. The default value is **TableStyleMedium7**.

The following examples show how to export an Excel workbook from a local server. For these examples, we have used the example workbook **How To Actions**.

- Generate and export Excel workbook
 - **Syntax:** `http://[server]/[path]/server/rest/media/excel?workbook={Workbook name}`

- **Example:** `http://localhost:8080/panopticon/server/rest/media/excel?workbook=How+To+Actions`

❑ Set dashboards

- **Syntax:** `http://[server]/[path]/server/rest/media/excel?workbook={Workbook name}&dashboard={Dashboard name1}&dashboard={Dashboard name2}`
- **Example:**
`http://localhost:8080/panopticon/server/rest/media/excel?workbook=How+To+Actions&dashboard=Data+Entry&Dashboard=Time+Parameters`

❑ Set height and width for Dashboard

- **Syntax:** `http://[server]/[path]/server/rest/media/excel?workbook={Workbook name}&width={value}&height={value}`
- **Example:**
`http://localhost:8080/panopticon/server/rest/media/excel?workbook=How+To+Actions&width=512&height=384`

❑ Set Excel table style

- **Syntax:** `http://[server]/[path]/server/rest/media/excel?workbook={Workbook name}&style={Style}`
- **Example:**
`http://localhost:8080/panopticon/server/rest/media/excel?workbook=How+To+Actions&style=TableStyleMedium6`

Possible Excel Table Styles

- ❑ TableStyleLight1 – TableStyleLight21
- ❑ TableStyleMedium1 – TableStyleMedium28
- ❑ TableStyleDark1 – TableStyleDark11

Dashboard Parameters

The Excel workbook can be generated based on the workbook data table parameters. The parameter and its values can be specified to determine the context of the generated Excel workbook.

Syntax: `http://[server]/[path]/server/rest/media/excel?workbook={Workbook name}&{dashboardParameterName1=value1}&{dashboardParameterName2=value2}`

Adding `Region=Europe` and `Industry=Financials` parameters

Example:

`http://localhost:8080/panopticon/server/rest/media/excel?workbook=How+To+Actions&Region=Europe&Industry=Financials`

Adding `Region=Asia Pacific`, or `Region=Europe` and `Industry= Financials` parameters produces an Excel workbook that is focused on Asia Pacific & European Financials. In this case the Region parameter is repeated for each of the supplied regions.

Example:

`http://localhost:8080/panopticon/server/rest/media/excel?workbook=How+To+Actions&Region=Asia+Pacific&Region=Europe&Industry=Financials`

EMAIL DATA

NOTE

To allow the triggering of the email send out via the REST API, Panopticon Real Time must be configured with valid email server information in the `Panopticon.properties` file located in the `AppData` folder (e.g., `c:\vizserverdata`).

See [Panopticon Real Time Configurations for Email Send Outs and Alerts](#) for instructions.

PDF

Panopticon Real Time provides the functionality to generate and email PDFs.

This feature works exactly as the URL PDF generation and uses the same URL parameters. The main difference between the two features is that this feature sends the PDF in an email rather than downloading it as a file. Another difference is this feature requires a POST request to the following URL:

```
http://[server]/[path]/server/rest/media/pdf/email.
```

Usage

The following properties can be configured:

- URL: `http://[server]/[path]/server/rest/media/pdf/email`
- Method: POST
- Content-Type: `application/json`
- Request body:
 - **bodyText** – The text will appear in the message body. The text can be formatted in HTML. Special characters, such as double quotation marks (") should have a backslash preceding them in order for the Server to regard them as special characters.
 - **to** - One or more email recipients. Comma is used as a delimiter to separate the email recipients.
 - **cc** – One or more email recipients. Comma is used as a delimiter to separate the email recipients.
 - **bcc** – One or more email recipients. Comma is used as a delimiter to separate the email recipients.
 - **sender** – The sender's email address. This value will also be used as a username.
 - **senderpassword** – The password to the sender's email account.
 - **subject** – the subject of the email.

Example

For example, an On-Demand PDF will be emailed based on the following information:

Property	Description
Workbook	How to Actions
Dashboard Name	Scatter of Filtered Universe
Recipients (To)	to-mail1@mail.com to-mail2@mail.com
Sender	from-mail@mail.com
Password	password
Subject	Altair PDF Generator
Body Message	Hello. This is an auto-generated PDF.

As an example:

Panopticon configuration (`Panopticon.properties`):

```
email.host=smtp.server.com
email.port=587
email.security.mode=TLS
```

URL:

```
http://localhost:8080/panopticon/server/rest/media/pdf/email?workbook=How+To+
Actions&dashboard=Scatter+of+Filtered+Universe
```

Body:

```
{
  "bodyText": "<h1>Hello.</h1><p>This is an auto-generated PDF.</p>",
  "to": "to-mail1@mail.com, to-mail2@mail.com",
  "sender": "from-mail@mail.com",
  "senderPassword": "password",
  "subject": "Altair PDF generator"
}
```

Image

Panopticon Real Time provides the functionality to generate and email dashboard images.

This feature is similar with Email PDF discussed above and uses the same URL parameters. However, this feature sends dashboard images as part of the email body and not as a PDF attachment. In addition, it does not support pagination.

In addition, hyperlinks can also be used in email dashboard images. Hyperlinks can redirect to a workbook and a dashboard in the server.

NOTE

In cases when you [schedule the emailing of dashboard images](#) or when you are behind a proxy or load balancer, it is recommended to specify the server address in the `Panopticon.properties` file.

For example:

```
server.host=http://www.company.com/dashboards/
```

The email contains the following *Body* components:

- Body message: The email starts with the provided body message in the request.
- Dashboard Title: The title displays before the dashboard image and uses a h2 heading tag.
- Dashboard image: The image (.png) of the dashboard.

Usage

- URL: `http://[server]/[path]/server/rest/media/image/dashboard/email`
- Method: POST
- Content-Type: `application/json`
- Request body:
 - **bodyText** – The text will appear in the message body. The text can be formatted in HTML. Special characters, such as double quotation marks (“”) should have a backslash preceding them in order for the Server to regard them as special characters.
 - **to** - One or more email recipients. Comma is used as a delimiter to separate the email recipients.
 - **cc** – One or more email recipients. Comma is used as a delimiter to separate the email recipients.
 - **bcc** – One or more email recipients. Comma is used as a delimiter to separate the email recipients.
 - **sender** – The sender’s email address. This value will also be used as a username.
 - **senderpassword** – The password to the sender’s email account.
 - **subject** – The subject of the email.
 - **useHyperlink** – The property that determines whether the images should be hyperlinks. The hyperlink then opens the dashboard in the Thin Client. Hyperlinks will be used when set to true (default value). The images will be regular images and not a hyperlink when the property is set to **false**.

Example

Property	Value
Workbook	How to Actions
Dashboard Name	Scatter of Filtered Universe
Recipients (To)	to-mail1@mail.com to-mail2@mail.com
Sender	from-mail@mail.com
Password	password
Subject	Altair Image Generator

Body Message	Hello. This email contains dashboard images.
Use hyperlink	true

As an example:

Panopticon configuration (panoption.properties):

```
email.host=smtp.server.com
email.port=587
email.security.mode=TLS
```

URL:

```
http://localhost:8080/panopticon/server/rest/media/image/dashboard/email?work
book=How+To+Actions&dashboard=Scatter+of+Filtered+Universe
```

Body:

```
{
  "bodyText": "<h1>Hello.</h1><p>This email contains dashboard
images.</p>",
  "to": "to-mail1@mail.com, to-mail2@mail.com",
  "sender": "from-mail@mail.com",
  "senderPassword": "password",
  "subject": "Altair Image generator",
  "useHyperlink": "true"
}
```

[17] LOGGING/MONITORING

SERVER LOGGING

Logging occurs:

- Within the platform
- In the underlying web / application server
- In the underlying OS

Panopticon Real Time logs are written to the `Tomcat` logs folder.

The logging level can be set from:

- Error – Only Errors are logged (the Default)
- Info – Operational logging is enabled including logging of data queries.
- Finest – All possible debugging logging is enabled.

Typically, when support issues are raised, the user is requested to change the logging level to **INFO**, which additionally records:

- Data Plugin (Visualization and Data Connector) Initialization
- Data Cache Initialization
- Data Subscriptions
- Data Queries including:
 - Database connection settings
 - Database SQL query
 - Number of rows & columns retrieved, and response time

Data query logging capabilities are specific to each data connector, with the most detailed logging available for the Database and kdb+ connectors.

Panopticon Real Time logging and auditing capabilities include Java JMX counters for usage and load monitoring, and additional logging around secured access to workbooks.

Configuring Server Logs

Panopticon Real Time is preconfigured with recommended logging settings for performance. All of the logging will be directed to a file prefixed by `panopticon` in the `Tomcat` logs folder. The Panopticon-specific logging configuration file is located inside the `.war` file at `WEB-INF/classes/logging.properties`. This configuration takes precedence over the general [Tomcat logging configuration](#). If the logging is to be configured in Tomcat, the file `WEB-INF/classes/logging.properties` must be removed from the `.war` file.

Configuring Apache Tomcat Logs¹

The internal logging for Apache Tomcat uses **JULI**, a packaged renamed fork of [Apache Commons Logging](#) that is hard-coded to use the `java.util.logging` framework. This ensures that Tomcat's internal logging and any web application logging will remain independent, even if a web application uses Apache Commons Logging.

To configure Tomcat to use an alternative logging framework for its internal logging, follow the instructions provided by the alternative logging framework for redirecting logging for applications that use `java.util.logging`. Keep in mind that the alternative logging framework will need to be capable of working in an environment where different loggers with the same name may exist in different class loaders.

A web application running on Apache Tomcat can:

- Use any logging framework of its choice
- Use system logging API, `java.util.logging`
- Use the logging API provided by the Java Servlets specification:
`javax.servlet.ServletContext.log(...)`

The logging frameworks used by different web applications are independent. See [class loading](#) for more details. The exception to this rule is `java.util.logging`. If it is used directly or indirectly by your logging library, then the elements of it will be shared across web applications because it is loaded by the system class loader.

Java Logging API (`java.util.logging`)

Apache Tomcat has its own implementation of several key elements of `java.util.logging` API. This implementation is called **JULI**. The key component there is a custom `LogManager` implementation, that is aware of different web applications running on Tomcat (and their different class loaders). It supports private per-application logging configurations. It is also notified by Tomcat when a web application is unloaded from memory, so that the references to its classes can be cleared, preventing memory leaks.

This `java.util.logging` implementation is enabled by providing certain system properties when starting Java. The Apache Tomcat startup scripts do this for you, but if you are using different tools to run Tomcat (such as `jsvc`, or running Tomcat from within an IDE), you should take care of them by yourself.

Servlets Logging API calls to `javax.servlet.ServletContext.log(...)` to write log messages are handled by internal Tomcat logging. Such messages are logged to the category named

```
org.apache.catalina.core.ContainerBase.[${engine}].[${host}].[${context}]
```

This logging is performed according to the Tomcat logging configuration. You cannot overwrite it in a web application.

The Servlets logging API predates the `java.util.logging` API that is now provided by Java. As such, it does not offer you much options. e.g., you cannot control the log levels. It can be noted, though, that in Apache Tomcat implementation the calls to `ServletContext.log(String)` or `GenericServlet.log(String)` are logged at the **INFO** level. The calls to `ServletContext.log(String, Throwable)` or `GenericServlet.log(String, Throwable)` are logged at the **SEVERE** level.

Console

When running Tomcat on unixes, the console output is usually redirected to the file named `catalina.out`. The name is configurable using an environment variable. Whatever is written to `System.err/out` will be caught into that file. That may include:

- Uncaught exceptions printed by `java.lang.ThreadGroup.uncaughtException(..)`

¹ <http://tomcat.apache.org/tomcat-9.0-doc/logging.html>

- ❑ Thread dumps, if you requested them via a system signal

When running as a service on Windows, the console output is also caught and redirected, but the file names are different.

The default logging configuration in Apache Tomcat writes the same messages to the console and to a log file. This is great when using Tomcat for development, but usually is not needed in production.

Old applications that still use `System.out` or `System.err` can be tricked by setting **swallowOutput** attribute on a Context. If the attribute is set to **true**, the calls to `System.out/err` during request processing will be intercepted, and their output will be fed to the logging subsystem using the `javax.servlet.ServletContext.log(...)` calls.

Note, that the **swallowOutput** feature is actually a trick, and it has its limitations. It works only with direct calls to `System.out/err`, and only during request processing cycle. It may not work in other threads that might be created by the application. It cannot be used to intercept logging frameworks that themselves write to the system streams, as those start early and may obtain a direct reference to the streams before the redirection takes place.

Access Logging

Access logging is a related but different feature, which is implemented as a **Valve**. It uses self-contained logic to write its log files. The essential requirement for access logging is to handle a large continuous stream of data with low overhead, so it only uses Apache Commons Logging for its own debug messages. This implementation approach avoids additional overhead and potentially complex configuration. Please refer to the [Valves](#) documentation for more details on its configuration, including the various report formats.

Using java.util.logging (Default)²

The default implementation of `java.util.logging` provided in the JDK is too limited to be useful. The key limitation is the inability to have per-web application logging, as the configuration is per-VM. As a result, Tomcat will, in the default configuration, replace the default LogManager implementation with a container friendly implementation called **JULI**, which addresses these shortcomings.

JULI supports the same configuration mechanisms as the standard JDK `java.util.logging`, using either a programmatic approach, or properties files. The main difference is that per-classloader properties files can be set (which enables easy redeployment friendly webapp configuration), and the properties files support extended constructs which allows more freedom for defining handlers and assigning them to loggers.

JULI is enabled by default, and supports per classloader configuration, in addition to the regular global `java.util.logging` configuration. This means that logging can be configured at the following layers:

- ❑ Globally

That is usually done in the `${catalina.base}/conf/logging.properties` file. The file is specified by the `java.util.logging.config.file` System property which is set by the startup scripts. If it is not readable or is not configured, the default is to use the `${java.home}/lib/logging.properties` file in the JRE.

- ❑ In the web application

The file will be `WEB-INF/classes/logging.properties`

The default `logging.properties` in the JRE specifies a `ConsoleHandler` that routes logging to **System.err**. The default `conf/logging.properties` in Apache Tomcat also adds several `FileHandlers` that write to files.

² <http://tomcat.apache.org/tomcat-9.0-doc/logging.html>

A handler's log level threshold is **INFO** by default and can be set using **SEVERE, WARNING, INFO, CONFIG, FINE, FINER, FINEST** or **ALL**. You can also target specific packages to collect logging from and specify a level.

To enable debug logging for part of Tomcat's internals, you should configure both the appropriate logger(s) and the appropriate handler(s) to use the **FINEST** or **ALL** level. e.g.:

```
org.apache.catalina.session.level=ALL
java.util.logging.ConsoleHandler.level=ALL
```

When enabling debug logging it is recommended that it is enabled for the narrowest possible scope as debug logging can generate large amounts of information.

The configuration used by JULI is the same as the one supported by plain `java.util.logging`, but uses a few extensions to allow better flexibility in configuring loggers and handlers. The main differences are:

- ❑ A prefix may be added to handler names, so that multiple handlers of a single class may be instantiated. A prefix is a String which starts with a digit and ends with '!'. For example, **22foobar.** is a valid prefix.
- ❑ System property replacement is performed for property values which contain `${systemPropertyName}`.
- ❑ If using a class loader that implements the `org.apache.juli.WebappProperties` interface (Tomcat's web application class loader does) then property replacement is also performed for `${classloader.webappName}`, `${classloader.hostName}` and `${classloader.serviceName}` which are replaced with the web application name, the host name and the service name respectively.
- ❑ By default, loggers will not delegate to their parent if they have associated handlers. This may be changed per logger using the `loggerName.useParentHandlers` property, which accepts a Boolean value.

The root logger can define its set of handlers using the `.handlers` property.

By default, the log files will be kept on the file system forever. This may be changed per handler using the `handlerName.maxDays` property. If the specified value for the property is `<=0` then the log files will be kept on the file system forever, otherwise they will be kept the specified maximum days.

There are several additional implementation classes, that can be used together with the ones provided by Java. The notable one is `org.apache.juli.FileHandler`.

`org.apache.juli.FileHandler` supports buffering of the logs. The buffering is not enabled by default. To configure it, use the `bufferSize` property of a handler. The value of 0 uses system default buffering (typically an 8K buffer will be used). A value of **<0** forces a writer flush upon each log write. A value **>0** uses a `BufferedOutputStream` with the defined value but note that the system default buffering will also be applied.

Example `logging.properties` file to be placed in `$CATALINA_BASE/conf`:

```

handlers = 1catalina.org.apache.juli.FileHandler, \
           2localhost.org.apache.juli.FileHandler, \
           3manager.org.apache.juli.FileHandler, \
           java.util.logging.ConsoleHandler

.handlers = 1catalina.org.apache.juli.FileHandler, java.util.logging.ConsoleHandler

#####
# Handler specific properties.
# Describes specific configuration info for Handlers.
#####

1catalina.org.apache.juli.FileHandler.level = FINE
1catalina.org.apache.juli.FileHandler.directory = ${catalina.base}/logs
1catalina.org.apache.juli.FileHandler.prefix = catalina.

2localhost.org.apache.juli.FileHandler.level = FINE
2localhost.org.apache.juli.FileHandler.directory = ${catalina.base}/logs
2localhost.org.apache.juli.FileHandler.prefix = localhost.

3manager.org.apache.juli.FileHandler.level = FINE
3manager.org.apache.juli.FileHandler.directory = ${catalina.base}/logs
3manager.org.apache.juli.FileHandler.prefix = manager.
3manager.org.apache.juli.FileHandler.bufferSize = 16384

java.util.logging.ConsoleHandler.level = FINE
java.util.logging.ConsoleHandler.formatter = java.util.logging.SimpleFormatter

#####
# Facility specific properties.
# Provides extra control for each logger.
#####

org.apache.catalina.core.ContainerBase.[Catalina].[localhost].level = INFO
org.apache.catalina.core.ContainerBase.[Catalina].[localhost].handlers = \
    2localhost.org.apache.juli.FileHandler

org.apache.catalina.core.ContainerBase.[Catalina].[localhost].[/manager].level = INFO
org.apache.catalina.core.ContainerBase.[Catalina].[localhost].[/manager].handlers = \
    3manager.org.apache.juli.FileHandler

# For example, set the org.apache.catalina.util.LifecycleBase logger to log
# each component that extends LifecycleBase changing state:
#org.apache.catalina.util.LifecycleBase.level = FINE

```

Example logging.properties for the servlet-examples web application to be placed in WEB-INF/classes inside the web application:

```

handlers = org.apache.juli.FileHandler, java.util.logging.ConsoleHandler

#####
# Handler specific properties.
# Describes specific configuration info for Handlers.
#####

org.apache.juli.FileHandler.level = FINE
org.apache.juli.FileHandler.directory = ${catalina.base}/logs
org.apache.juli.FileHandler.prefix = ${classloader.webappName}.

java.util.logging.ConsoleHandler.level = FINE
java.util.logging.ConsoleHandler.formatter =
java.util.logging.SimpleFormatter

org.apache.catalina.core.ContainerBase.[Catalina].[localhost].[/manager].level = INFO
org.apache.catalina.core.ContainerBase.[Catalina].[localhost].[/manager].handlers = \
    3manager.org.apache.juli.FileHandler

# For example, set the org.apache.catalina.util.LifecycleBase logger to log
# each component that extends LifecycleBase changing state:
#org.apache.catalina.util.LifecycleBase.level = FINE

```

AUDIT LOGGING

Panopticon Real Time can also produce audit logs. All of the audit logging will be directed to a file prefixed 'panopticon-audit' in the Tomcat `log` folder. The audit logs can be configured just like the regular logs produced by Panopticon Real Time. Refer to [Configuring Panopticon Real Time Logs](#) for more information on how to configure logs.

Panopticon Real Time is pre-configured to generate audit logs on an **INFO** level. Most of the messages are logged with **INFO** level. However, there are certain actions that are logged at different levels, such as **FINE**.

The audit logs contain the following information:

Attribute	Description
Timestamp	Timestamp for when the executed action occurred. The format of the timestamp is YYYY-mm-ddTHH:MM:SS (e.g., 2015-12-24T15:30:40).
Log Level	The severity of the log level.
Username	The username of the user that executed the action. The username will be ANONYMOUS if the user is not authenticated.
IP-address	The user's IP address.
Action	Detailed message about the executed action.

Audit logs use comma (,) as a delimiter to separate these values.

SERVER MONITORING

Panopticon Real Time publishes the following JMX counters:

- ServerDataRequestCount
- ActiveDataRequestCount
- InfoMessageCount
- ErrorMessageCount
- ActiveRealtimeSubscriptionCount
- LoadedWorkbooksCount
- MemoryStoreObjectCount
- ObjectCount

These can be accessed through any JMX monitoring toolset, such as Jconsole from the Java Development Kit (JDK).

As a basic configuration:

3. Download and install Java Development Kit (JDK)
<http://www.oracle.com/technetwork/java/javase/downloads/jdk8-downloads-2133151.htm>
4. Add the following parameters to your Tomcat:
 - -Dcom.sun.management.jmxremote.port=8855
 - -Dcom.sun.management.jmxremote.authenticate=false
 - -Dcom.sun.management.jmxremote.ssl=false
5. Open Jconsole. The jconsole executable can be found in `JDK_HOME/bin`, where `JDK_HOME` is the directory in which the Java Development Kit (JDK) is installed.
6. When the connection dialog opens, you are also given the option of connecting to a remote process.
 - -Host name: name of the machine on which the Java VM is running.
 - -Port number: the JMX agent port number you specified when you started the Java VM (e.g., **8855**)

WEB PORTAL INTEGRATION

Panopticon workbooks can be embedded into existing portals with minimal effort. An `iframe` folder example in `webapps\panopticon\api` is included in the release, which details how to include the HTML client inside an `iframe`.

This folder includes the following files:

- CSS for styling and animations
- JavaScript for logic and control
- Help page with the post message example and the list of actions that HTML5 Client supports
 - `getWorkbooks`

- getDashboards
- getSelectedWorkbook
- getSelectedDashboardParameters
- getBookmarks
- addDashboardChangedListener
- addParametersChangedListener
- setWorkbook
- setDashboard
- setBookmark
- setParameters

The custom page simply needs to implement the embedded Web client as the source of the iframe tag. For example:

```
<div class="right-column">  
  <iframe id="datawatch" src="[url_to_web_client]"  
  name="datawatch"></iframe>  
</div>
```

You can then access the JavaScript API through the iframe ID reference, where you can for instance, navigate to another dashboard or workbook.

[18] TROUBLESHOOTING

RESOLVING INSTALLATION ISSUES

Issues are investigated and resolved through investigation and controlled reproduction. Several known issues are included in the next section and predominately relate to problematic installations of Panopticon Real Time.

If you experience an unknown issue, send complete details to: dasupport@altair.com

Be sure to send this important information to Altair Support in the event of a problem.

Server Log

Panopticon Real Time log files are located in the `[tomcat_home]\logs` folder.

The level of detail for these log files are configured at the "level" sections of `logging.properties` file in `[tomcat_home]\conf` folder.

By default, it is set to **Error**, while the most verbose is **Info**.

Steps:

1. Edit the value of "level" in the `logging.properties` file:

From:

```
org.apache.catalina.core.ContainerBase.[Catalina].[localhost].level = ERROR
```

To:

```
org.apache.catalina.core.ContainerBase.[Catalina].[localhost].level = INFO
```

NOTE

Modifying the `level` setting will consume more disk space, so make sure to only do this while troubleshooting.

2. Restart Tomcat after making these changes.

NOTE

Refer to [Configuring Server Logs](#) for more information.

When sending your issue, include your workbook and associated data sources if the issue is specific to a particular workbook.

NO APPROPRIATE PROTOCOL ERROR WHEN PUBLISHING SPLUNK DATA ON PANOPTICON REAL TIME

The Altair log written into Panopticon Real Time log can report errors similar to the following:

Caused by: `javax.net.ssl.SSLHandshakeException: No appropriate protocol (protocol is disabled or cipher suites are inappropriate)`

This is caused by having the SSLv3 disabled by default in the updated versions of JDK.

Steps:

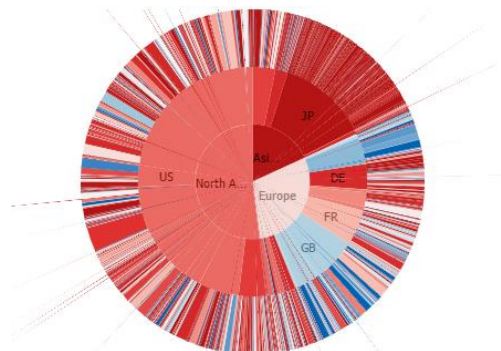

1. Open the `/lib/security/java.security` file.
2. Comment the following line:

```
#jdk.tls.disabledAlgorithms=SSLv3
```
3. Save the updated file.

PIE CHARTS AND SHAPES NOT DISPLAYING CORRECTLY IN CHROME

When Hardware Acceleration is enabled in Chrome, Pie Chart and Shape visualization may not display as expected.

For example:

To resolve this issue, follow the steps below to disable Hardware Acceleration in Chrome:

1. Open the Chrome web browser.
2. You can either:
 - click  to the right of the *Address* box and select **Settings**
 - Or enter `chrome://settings` in the *Address* box.
3. Scroll to the bottom of the page and click **Show Advanced Settings...**
4. Uncheck Use Hardware Acceleration when Available box.

System

- Continue running background apps when Google Chrome is closed
- Use hardware acceleration when available (requires Chrome [restart](#))

5. Restart Chrome.

SESSION TOKENS NOT WORKING IN CHROME

Setting the `authentication.token.persistence` property to **SESSION** in `Panopticon.properties` removes the token from the browser if it is shutdown.

In Google Chrome, you can override the session functionality if you select **Continue where you left off** option in the *On startup* section. However, if you opt to use session cookies, select **Open the New Tab page** option.

Steps

1. Open the Chrome web browser.
2. You can either:
 - click  to the right of the *Address* box and select **Settings**
 - Or enter `chrome://settings` in the *Address* box.
3. Scroll to the bottom of the page and on the *On startup* section, you can either select:
 - Open the New Tab page
To use the session cookies.
 - Continue where you left off

To override the session functionality.

4. Restart Chrome.

MANAGED ALTAIR UNITS LICENSE SSL ERROR

If you encounter the following issue when using Managed Altair Units license:

```
"SSL_ERROR_SSL  
error:14007086:SSL routines:CONNECT_CR_CERT:certificate verify failed  
unable to get local issuer certificate"  
Detail: SSL/TLS handshake failed
```

Follow the steps below to resolve this error:

1. Make sure you have installed all updates and are using the latest version of the product. The latest version is always available from the [Marketplace](#).
2. Work with your IT department to create an exception in your proxy for the traffic going to our servers:
 - <https://client.hhwu.altair.com>
 - <https://auth.hhwu.altair.com>
 - <https://auth.login.solidthinking.com>
 - <https://auth.admin.altairone.com>
 - <https://alas.admin.altairone.com>

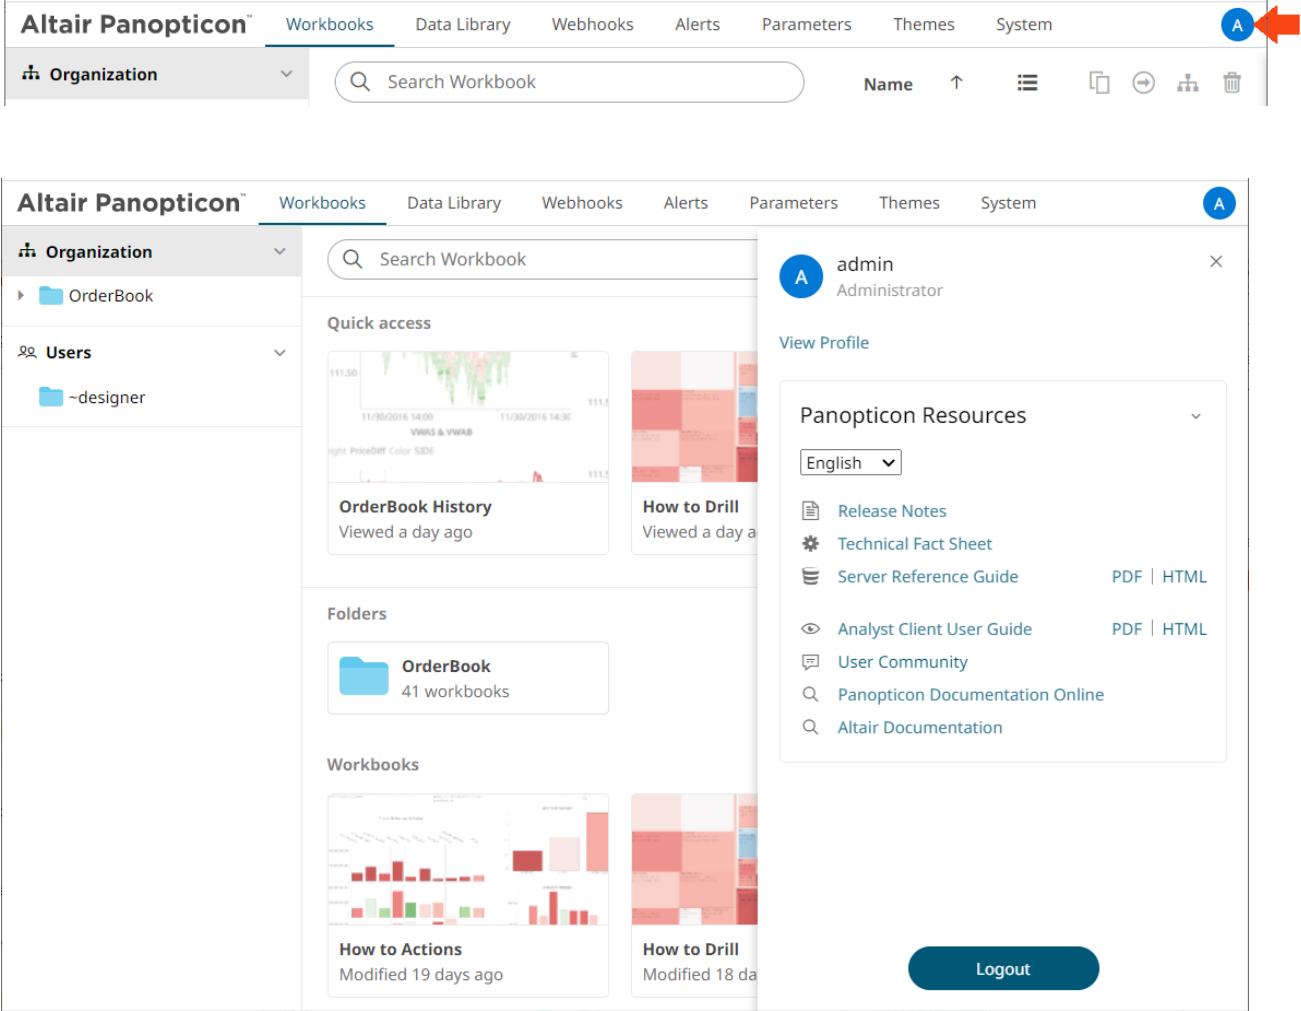

[19] KNOWN ISSUES

OUT OF MEMORY EXCEPTION

If the data is too big, an out of memory exception may occur. To increase the memory of Panopticon Real Time in Tomcat for Linux, refer to [Tomcat Memory Configuration for Linux](#) for more information.

[20] PANOPTICON RESOURCES

Clicking the user profile icon  on the top right section of the toolbar displays the other Panopticon online resources that users with an Administrator role can access.

Select the *Language* on the drop-down list: **English** or **Japanese**.

Resource	Description
Release Notes	List of new features and fixed issues in the release.
Technical Fact Sheet	Overview of the Panopticon components which consists of: <ul style="list-style-type: none"> • system requirements • features • supported data connectivity and visualizations • custom code data connections, transforms, and ML model scoring • filtering and data capabilities
Real Time Reference Guide	Panopticon Real Time documentation for users with an Administrator role which consists of: <ul style="list-style-type: none"> • installation, system requirements, and licensing options • supported authentication mechanisms • advanced and optional steps or deployments • system administration of the server including the logs, subscriptions, caches, scheduled tasks, and logged in users • viewing and managing of workbooks and data templates • creating and managing of data templates, global parameters, alerts, workbook themes • PCLI command utilities • REST API examples • troubleshooting guide • <code>Panopticon.properties</code> discussion Available upon installation.
Analyst Client User Guide	Panopticon Real Time documentation for users with a Viewer role which consists of: <ul style="list-style-type: none"> • viewing and analysing of workbooks • creating, monitoring, and deleting of alerts Available upon installation.
User Community	Link to the Panopticon User Community page.
Data Analytics Documentation	Link to the Altair Data Analytics Documentation page.

[APPENDIX]

PROPERTIES: PANOPTICON

The majority of configuration options for the server are set in the `Panopticon.properties` file in the `<appdata>` directory (e.g., `C:\vizserverdata`). If this file does not exist when the server starts, it will create it with all default values. When the server starts after an upgrade, it may add new properties and remove deprecated ones.

You can optionally move sensitive properties like passwords and URLs from this file, where they are stored in clear text, into a file named `Secret.properties` in the same directory. The `Secret.properties` file stores values encrypted, and you can manage it with [PCLI](#). A property can only be defined in one of these files at a time.

The following properties can be set in the property files:

Property	Access
Attribute	<code>access.administrator.groups</code>
Description	The role that is mapped to the administrator group.
Default Value	admin
Property	Access
Attribute	<code>access.administrator.users</code>
Description	Normally administrator access should be handled with the <code>access.administrator.groups</code> mapping, but for scenarios where the authentication cannot provide roles or you want to make exceptions for specific users, you can list individual usernames in this property. Any user listed here will get administrator access, regardless of their roles. Separate multiple users with the access.list.delimiter .
Default Value	
Property	Access
Attribute	<code>access.default.roles</code>
Description	The default roles applied to all users of the server. For example, if <code>access.default.roles=DESIGNER,ADMINISTRATOR</code> and a user with a VIEWER role logs on to the server, then the user will simultaneously have a VIEWER, DESIGNER, and ADMINISTRATOR roles. However, if no default roles are wanted, then leave the property blank. NOTE: The roles that can be assigned in this property can only be ADMINISTRATOR, VIEWER, ANONYMOUS, and/or DESIGNER. This property is case sensitive.
Default Value	VIEWER
Property	Access

Attribute	<code>access.designer.groups</code>
Description	The role that is mapped to the designer group.
Default Value	designer
Property	Access
Attribute	<code>access.designer.users</code>
Description	<p>Normally designer access should be handled with the <code>access.designer.groups</code> mapping, but for scenarios where the authentication cannot provide roles or you want to make exceptions for specific users, you can list individual usernames in this property.</p> <p>Any user listed here will get designer access, regardless of their roles.</p> <p>Separate multiple users with the access.list.delimiter.</p>
Default Value	
Property	Access
Attribute	<code>access.list.delimiter</code>
Description	<p>The value delimiter to use when parsing access groups.</p> <p>Examples:</p> <p><code>access.list.delimiter=,</code> <code>access.administrator.groups=group1,group2</code></p> <p>The groups are mapped to <code>{'group1', 'group2'}</code></p> <p><code>access.list.delimiter=;</code> <code>access.administrator.groups=group1;group2,group3</code></p> <p>The groups are mapped to <code>{'group1;group2', 'group3'}</code></p> <p><code>access.list.delimiter=;</code> <code>access.administrator.groups=group1;group2,group3</code></p> <p>The groups are mapped to <code>{'group1', 'group2,group3'}</code></p>
Default Value	',' (comma)
Property	Access
Attribute	<code>access.viewer.groups</code>
Description	The role that is assigned to the viewer group.
Default Value	
Property	Access
Attribute	<code>access.viewer.users</code>
Description	<p>Normally viewer access should be handled with the <code>access.viewer.groups</code> mapping, but for scenarios where the authentication cannot provide roles or you want to make exceptions for specific users, you can list individual usernames in this property.</p> <p>Any user listed here will get viewer access, regardless of their roles.</p>

	Separate multiple users with the access.list.delimiter .
Default Value	
Property	Alert
Attribute	<code>alert.creation.only.by.administrators</code>
Description	Enable or disable whether only the Administrators can create alerts.
Default Value	false
Property	Alert
Attribute	<code>alert.detailed.logging</code>
Description	Enables or disables extra alert logging.
Default Value	false
Property	Service authentication level
Attribute	<code>authentication.domain</code>
Description	The default domain information for user authentication.
Default Value	
Property	Authentication: Filter Token
Attribute	<code>authentication.filter.authenticate.token</code>
Description	Applies only if <code>authentication.type</code> is set to FILTER or is blank. If this property is set to true, the server will validate the token on incoming requests. If set to false, it ignores the token and authenticates based on the rest of the request instead.
Default Value	false
Property	Authentication: Header
Attribute	<code>authentication.header.role.delimiter</code>
Description	The delimiter used to separate the roles. Example: role1,role2,role3
Default Value	, (Comma)
Property	Authentication: Header
Attribute	<code>authentication.header.roles</code>
Description	The name of the header that contains all the roles.
Default Value	
Property	Authentication: Header
Attribute	<code>authentication.header.rolesdynamic</code>
Description	Supports the ability to create dynamic roles using free form patterns or string replacement. To create dynamic roles, use '{header value to be used}'. Example: <code>authentication.header.rolesdynamic={HEADER_ROLES},financials,role_for_company_{HEADER_COMPANY}</code>

	<p>Given this table:</p> <table border="1"> <thead> <tr> <th>KEY</th> <th>VALUE</th> </tr> </thead> <tbody> <tr> <td>HEADER_ROLES</td> <td>designer, watcher</td> </tr> <tr> <td>HEADER_COMPANY</td> <td>industrials, consumers</td> </tr> </tbody> </table> <p>Then the roles to create the authentication token will be the following:</p> <ul style="list-style-type: none"> designer watcher financials role_for_company_industrials role_for_company_consumers 	KEY	VALUE	HEADER_ROLES	designer, watcher	HEADER_COMPANY	industrials, consumers
KEY	VALUE						
HEADER_ROLES	designer, watcher						
HEADER_COMPANY	industrials, consumers						
Default Value							
Property	Authentication: Header						
Attribute	<code>authentication.header.username</code>						
Description	The name of the header that contains the username						
Default Value							
Property	Authentication: Header						
Attribute	<code>authentication.header.validate.token</code>						
Description	If set to true , the authentication will validate the token. If set to false , the authentication of every request will be based on headers.						
Default Value							
Property	Authentication: Logout						
Attribute	<code>authentication.logout.redirect.url</code>						
Description	Takes a URL as a parameter. Clicking the logout button redirects the user to the specified URL. If this property is not set, user will be returned to the start page of Panopticon.						
Default Value							
Property	Authentication: OAuth 2.0						
Attribute	<code>authentication.oauth2.client.id</code>						
Description	The ID of the OAuth 2.0 client.						
Default Value							
Property	Authentication: OAuth 2.0						
Attribute	<code>authentication.oauth2.client.secret</code>						
Description	The secret used by the OAuth 2.0 client.						
Default Value							
Property	Authentication: OAuth 2.0						

Attribute	<code>authentication.oauth2.identity.attribute.roles</code>
Description	The attribute that will be extracted from the <i>identity response</i> and used as the role.
Default Value	
Property	Authentication: OAuth 2.0
Attribute	<code>authentication.oauth2.identity.attribute.roles.pattern</code>
Description	Takes regex used to extract the roles from the OAuth 2.0 server identity response. For example, the returned string: <code>cn=admin,ou=groups,dc=openam,dc=openidentityplatform,dc=org,cn=designer,ou=groups,dc=openam,dc=openidentityplatform,dc=org</code> contains two roles, admin and designer The regex to extract the roles is <code>cn=([^\,]+)</code> .
Default Value	
Property	Authentication: OAuth 2.0
Attribute	<code>authentication.oauth2.identity.attribute.username</code>
Description	The attribute that will be extracted from the identity response and used as the username.
Default Value	
Property	Authentication: OAuth 2.0
Attribute	<code>authentication.oauth2.identity.method</code>
Description	The method on how the access token is passed along in the identity request. Supported values are QUERY , BODY , and HEADER .
Default Value	QUERY
Property	Authentication: OAuth 2.0
Attribute	<code>authentication.oauth2.identity.url</code>
Description	The URL to the REST service that provides details about the authenticated user.
Default Value	
Property	Authentication: OAuth 2.0
Attribute	<code>authentication.oauth2.login.callback.url</code>
Description	The callback URL. The URL should be the same as one of the specified callback URLs used by the client. The URL should refer to Panopticon Real Time.
Default Value	
Property	Authentication: OAuth 2.0
Attribute	<code>authentication.oauth2.login.redirect.url</code>
Description	Redirects the user to the specified URL after successfully logging in. This property can be left blank, in which case the user is redirected to the URL they requested to access.
Default Value	
Property	Authentication: OAuth 2.0

Attribute	<code>authentication.oauth2.login.response.type</code>
Description	The response type. The only response type that is currently supported is code .
Default Value	
Property	Authentication: OAuth 2.0
Attribute	<code>authentication.oauth2.login.scope</code>
Description	The requested scope.
Default Value	
Property	Authentication: OAuth 2.0
Attribute	<code>authentication.oauth2.login.url</code>
Description	The URL to the OAuth 2.0 login resource.
Default Value	
Property	Authentication: OAuth 2.0
Attribute	<code>authentication.oauth2.logout.redirect.url</code>
Description	Logging out revokes the token from the authentication server if the property <code>authentication.oauth2.logout.url</code> is set to the revocation URL. If this property is not set, the server will only remove its own token. If none of these properties are set, the server will attempt to redirect to the start page of the Panopticon when logging out.
Default Value	
Property	Authentication: OAuth 2.0
Attribute	<code>authentication.oauth2.logout.url</code>
Description	The URL to the OAuth 2.0 logout resource.
Default Value	
Property	Authentication: OAuth 2.0
Attribute	<code>authentication.oauth2.token.method</code>
Description	The method on how the token should be retrieved. Supported values are QUERY , BODY , and HEADER .
Default Value	
Property	Authentication: OAuth 2.0
Attribute	<code>authentication.oauth2.token.url</code>
Description	The URL to the OAuth 2.0 token resource.
Default Value	
Property	Service authentication level
Attribute	<code>Authentication.required</code>
Description	The property that will make the authentication required. It will force the user to login in order to use any of the services provided by the server.

Default Value	true
Property	Service authentication level
Attribute	<code>authentication.role</code>
Description	The authentication role.
Default Value	
Property	Authentication: SAML
Attribute	<code>authentication.saml.assertion.roles</code>
Description	User attribute for roles configured in the IdP.
Default Value	
Example	<code>authentication.saml.assertion.roles=roles</code>
Property	Authentication: SAML
Attribute	<code>authentication.saml.assertion.username</code>
Description	User attribute for username configured in the IdP.
Default Value	
Example	<code>authentication.saml.assertion.username=name</code>
Property	Authentication: SAML
Attribute	<code>authentication.saml.assertionconsumerservice.url</code>
Description	The URL to the Panopticon assertion consumer service. URL: [Protocol]://[Host]:[Port]/[Context]/server/rest/auth/login Example: http://localhost:8080/panopticon/server/rest/auth/login
Default Value	
Example	<code>authentication.saml.assertionconsumerservice.url=http://localhost:8080/panopticon/server/rest/auth/login</code>
Property	Authentication: SAML
Attribute	<code>authentication.saml.certificate.name</code>
Description	The name of the certificate used to validate signature and/or sign outgoing SAML messages
Default Value	
Example	<code>authentication.saml.certificate.name=saml-cert</code>
Property	Authentication: SAML
Attribute	<code>authentication.saml.certificate.password</code>
Description	The password of the certificate used to validate signature and/or sign outgoing SAML messages.
Default Value	
Property	Authentication: SAML

Attribute	<code>authentication.saml.challenge.required</code>
Description	This property determines whether the IdP-first authentication with SAML is enabled or not. To enable, set this property to false .
Default Value	true
Property	Authentication: SAML
Attribute	<code>authentication.saml.identityprovider.certificate.file</code>
Description	Takes a file path to a certificate file that contains the IdP's public key.
Default Value	
Property	Authentication: SAML
Attribute	<code>authentication.saml.identityprovider.logout.url</code>
Description	The URL to the IdP logout service.
Default Value	
Property	Authentication: SAML
Attribute	<code>authentication.saml.identityprovider.signature.validation.required</code>
Description	Specifies whether to require a valid IdP signature to be present on the SAML response. Default value is false .
Default Value	false
Property	Authentication: SAML
Attribute	<code>authentication.saml.identityprovider.url</code>
Description	The URL to the IdP login service.
Default Value	
Example	<code>authentication.saml.identityprovider.url=https://192.168.99.100:443/simplesaml/saml2/idp/SSOService.php</code>
Property	Authentication: SAML
Attribute	<code>authentication.saml.keystore.file</code>
Description	The location of the Keystore file that contains the certificate.
Default Value	
Example	<code>authentication.saml.keystore.file=D:/SAML/mykeystore.jks</code>
Property	Authentication: SAML
Attribute	<code>authentication.saml.keystore.password</code>
Description	The password to the Keystore file.
Default Value	
Property	Authentication: SAML
Attribute	<code>authentication.saml.keystore.type</code>
Description	The key store type. Possible values are JKS , JCEKS , PKCS12 .

Default Value	JKS
Property	Authentication: SAML
Attribute	<code>authentication.saml.login.redirect.url</code>
Description	Redirects the user to the specified URL after successfully logging in. This property can be left blank, in which case the user is redirected to the URL they requested to access.
Default Value	
Property	Authentication: SAML
Attribute	<code>authentication.saml.logout.redirect.url</code>
Description	Redirects the user back to the specified URL after logging out. This is mainly used with a proxy. In which case, Panopticon Real Time does not know the endpoint which the user is going towards to, and therefore cannot redirect the user back to the Overview page. If you are using OpenAM this is required, otherwise this property can be left blank.
Default Value	
Property	Authentication: SAML
Attribute	<code>authentication.saml.openam.meta.alias</code>
Description	The meta alias for the IdP if you are using OpenAM.
Default Value	
Property	Authentication: SAML
Attribute	<code>authentication.saml.protocolbinding</code>
Description	Protocol binding for the use of SAML authentication. Possible values are HTTP-Redirect , HTTP-POST , HTTP-Artifact , HTTP-POST-SimpleSign , or SOAP .
Default Value	HTTP-Redirect
Property	Authentication: SAML
Attribute	<code>authentication.saml.provider</code>
Description	The IdP provider. Possible values are OPENSAML , OPENAM .
Default Value	OPENSAML
Property	Authentication: SAML
Attribute	<code>authentication.saml.serviceprovider.id</code>
Description	The ID of the service provider configured in the IdP.
Default Value	
Example	<code>authentication.saml.serviceprovider.id=DwchFrontLocal8080</code>
Property	Service authentication login request
Attribute	<code>authentication.timeout.callback</code>
Description	The timeout (in milliseconds) for the user between initiated login and callback. The default value is five minutes.
Default Value	300000

Property	Authentication: Token
Attribute	<code>authentication.token.cookie</code>
Description	The name of the cookie used to store the authentication cookie. Must be unique for each server instance on the host.
Default Value	ptoken
Property	Authentication: Token
Attribute	<code>authentication.token.cookie.httponly</code>
Description	This property determines how the browser will treat the cookie. If set to true , the cookie will be stored in the browser as a HttpOnly cookie and will not be available to the JavaScript. If set to false (default), the cookie will be stored in the browser as https and will be accessible to the JavaScript.
Default Value	false
Property	Authentication: Token
Attribute	<code>authentication.token.cookie.samesite</code>
Description	Used by browsers to control the behavior of same or cross origin requests. There are three possible values. Lax , Strict , and None . Please refer to browser specific documentation for its usage.
Default Value	Lax
Property	Authentication: Token
Attribute	<code>authentication.token.cookie.secure</code>
Description	The property determines how the browser will treat the cookie depending on the security of the connection. If set to true , when the browser receives a secure cookie (HttpOnly cookie), you will not be able to transmit it unless the connection is secure.
Default Value	false
Property	Authentication: Token
Attribute	<code>authentication.token.domain</code>
Description	Specifies the token cookie domain.
Default Value	
Property	Authentication: Token
Attribute	<code>authentication.token.in.login.response.body</code>
Description	This property determines if the REST login response body should contain a token info. NOTE: Does not affect the SOAP login response body.
Default Value	false
Property	Authentication: Token
Attribute	<code>authentication.token.persistence</code>
Description	This property is used to determine if the token should persist if the browser is closed or if it should only last while the browser is open. There are two possible values: PERSISTENT and SESSION . PERSISTENT will persist the token in the browser even if

	<p>the browser has been closed and reopened. SESSION will remove the token from the browser if it is shutdown.</p> <p>IMPORTANT:</p> <p>After modifying the property value to SESSION, ensure to clear the <code>AppData/Token</code> folder before starting the server.</p>
Default Value	PERSISTENT
Property	Authentication: Token
Attribute	<code>authentication.token.refreshable</code>
Description	This property determines if the token can refresh itself. The Web client can identify if the token is about to expire and then request a new token with the existing token. A token is refreshable if the property is set to true . The token will expire and invalidate the user session if the property is set to false .
Default Value	true
Property	Authentication: Token
Attribute	<code>authentication.token.secret</code>
Description	The secret is used to sign the token. The secret will be auto-generated when the server starts for the first time.
	NOTE: <i>This value should be kept a secret.</i>
Default Value	Auto-generated
Property	Authentication: Token
Attribute	<code>authentication.token.validity.seconds</code>
Description	The number of seconds that the token should be valid.
Default Value	604800
Property	Service authentication level
Attribute	<code>authentication.type</code>
Description	The type of the authentication mechanism that will be used on the Server.
Default Value	BASIC
Property	Bookmark Administration
Attribute	<code>bookmark.administration.only.by.administrators</code>
Description	Set to true if only Administrators should be able to manage bookmarks.
Default Value	false
Property	Bookmark Administration
Attribute	<code>bookmark.show_shared</code>
Description	Allows private bookmarking. If set to true , all of the users will be able to view each other's bookmarks. If set to false , bookmarks will only be viewed by the one who created them.
Default Value	true
Property	Cache
Attribute	<code>cache.data.datasource.enabled</code>

Description	Enable or disable the caching of the data source.
Default Value	true
Property	Cache
Attribute	<code>cache.data.datasource.size</code>
Description	The data source cache size.
Default Value	100
Property	Cache
Attribute	<code>cache.data.datasource.type</code>
Description	The data source cache type. Allowed values: MEMORY, NONE
Default Value	MEMORY
Property	Cache
Attribute	<code>cache.data.datatable.enabled</code>
Description	Enable or disable the caching of the data table.
Default Value	true
Property	Cache
Attribute	<code>cache.data.datatable.size</code>
Description	The data table cache size.
Default Value	100
Property	Cache
Attribute	<code>cache.data.datatable.type</code>
Description	The data table cache type. Allowed values: MEMORY, NONE
Default Value	MEMORY
Property	Cache
Attribute	<code>cache.data.query.enabled</code>
Description	Enable or disable the caching of data query.
Default Value	true
Property	Cache
Attribute	<code>cache.data.query.size</code>
Description	The data query cache size.
Default Value	100
Property	Cache
Attribute	<code>cache.data.query.type</code>
Description	The data query cache type. Allowed values: MEMORY, NONE

Default Value	MEMORY
Property	Cache
Attribute	<code>cache.plugin.id</code>
Description	The ID of the plugin that will be used to store data. Possible values: BinaryTableFile-Cache .
Default Value	BinaryTableFile-Cache
Property	Cache
Attribute	<code>cache.purge.condition</code>
Description	Defines the condition for when the cache will be purged. Allowed values: NONE, MEMORY
Default Value	MEMORY
Property	Cache
Attribute	<code>cache.purge.condition.memory.threshold</code>
Description	Defines a percentual memory threshold for cache purging, when the <code>cache.purge.condition = MEMORY</code> .
Default Value	80
Property	Cache
Attribute	<code>cache.purge.enabled</code>
Description	Enables scheduled cache purging.
Default Value	true
Property	Cache
Attribute	<code>cache.schedule.clear.enabled</code>
Description	Enable the cache clearing schedule. This is scheduling the clear cache operation which will remove all the expired cache entries.
Default Value	true
Property	Cache
Attribute	<code>cache.service.enabled</code>
Description	Enables or disables the service cache.
Default Value	true
Property	Cache
Attribute	<code>cache.service.type</code>
Description	The service cache mechanism being used.
Default Value	IN_MEMORY
Property	Client Cache
Attribute	<code>client.cache.control.age.max</code>

Description	Controls the cache-control max-age header for static content.
Default Value	31536000
Property	Client Data
Attribute	<code>client.data.load.transport</code>
Description	Configure the transportation protocol for loading data from the Web client. Possible values: WEBSOCKET, LONG_POLLING. NOTE: This property has been deprecated. Refer to Setting the Transportation Protocol for more information.
Default Value	WEBSOCKET
Property	Server Cluster
Attribute	<code>cluster.bully.bind</code>
Description	The URL of the server in bully mode. This should be the URL to the panopticon server web application on the server itself, by which is reachable from the other servers.
Default Value	
Property	Server Cluster
Attribute	<code>cluster.bully.boot</code>
Description	Comma-separated list of server URLs in bully mode. At least one of these servers should be running at all time for the bully mode to work correctly. The URLs should be the same as the <code>cluster.bully.bind</code> value on each boot server.
Default Value	
Property	Server Cluster
Attribute	<code>cluster.bully.id</code>
Description	The unique server ID in bully mode. Can be any string, but do not change it after the server has participated in a cluster -- the other servers will store it and expect it to identify the same server in the future. The running server with the lowest ID lexicographically will be leader.
Default Value	
Property	Server Cluster
Attribute	<code>cluster.fixed.leader</code>
Description	The leader URL in fixed mode. This should be the URL to the panopticon server web application on the preset leader server, by which it is reachable from the follower servers. Leave blank on the leader server itself.
Default Value	
Property	Server Cluster
Attribute	<code>cluster.kubernetes.container_name</code>
Description	Optionally name of the container that runs the Panopticon server, if the pod also runs other containers. If left blank, the first container will be used.

Default Value	
Property	Server Cluster
Attribute	<code>cluster.kubernetes.id</code>
Description	Set to the name of the pod that runs the container.
Default Value	(blank)
Property	Server Cluster
Attribute	<code>cluster.kubernetes.label_selector</code>
Description	Standard Kubernetes label selector that should only match the pods that are running the server.
Default Value	
Property	Server Cluster
Attribute	<code>cluster.kubernetes.peer_path</code>
Description	Path to the web application on each server. For example, "panopticon/", or "/" if you have deployed to Tomcat's root.
Default Value	
Property	Server Cluster
Attribute	<code>cluster.mode</code>
Description	NONE (default), FIXED , BULLY , or KUBERNETES
Default Value	
Property	Server Cluster
Attribute	<code>cluster.shared.secret</code>
Description	Any alphanumeric string. Secret used to encrypt a challenge in peer-to-peer communication handshake. Needs to be the same, and non-empty, on all connected servers.
Default Value	
Property	Server Cluster
Attribute	<code>cluster.shared.store.shared_directory.path</code>
Description	Shared store location in SHARED_DIRECTORY mode. This path must be reachable by all connected servers and must point to the same physical directory on all of them.
Default Value	
Property	Server Cluster
Attribute	<code>cluster.shared.store.type</code>
Description	PRIVATE_DIRECTORY (default) or SHARED_DIRECTORY The shared store is used to store information that should be synchronized between servers but is not content, for example authentication tokens. If you have a tightly-coupled

	cluster, e.g., behind a load balancer, it is recommended that you configure this as a shared directory.
Default Value	
Property	AMPS Connector Custom Authenticator
Attribute	<code>connector.amps.authenticators</code>
Description	This property is required when a custom authenticator is needed for AMPS connection. A custom authenticator needs be implemented as java .JAR file. The property expects a JSON object, where key is fully qualified name of the Authenticator Java class, and values are list of constructor parameter names, e.g., <pre>{"com.panopticon.examples.amps.AMPSClientAuthenticator": ["User", "Shared Key"]}</pre>
Default Value	
Property	Connector File Path
Attribute	<code>connector.common.filepath.link.disabled</code>
Description	If set to true , the <i>Link to File</i> option will not be available.
Default Value	false
Property	DolphinDB – Streaming Beta
Attribute	<code>connector.dolphindb.subscription.host</code>
Description	This property is used to create DolphinDB java API Client to set the host name of the subscribing application, in this case host running Panopticon server.
Default Value	127.0.0.1
Property	DolphinDB – Streaming Beta
Attribute	<code>connector.dolphindb.subscription.port</code>
Description	This property is used to create DolphinDB java API Client to set the post number available at the host running Panopticon server.
Default Value	41333
Property	Host Lookup
Attribute	<code>connector.kdb.host.lookup.script</code>
Description	Full path of the shell script file that is accessible on the server. When set, before making a new kdb+ connection, this script is executed to get the host info. This property helps in overriding connection details entered inside the kdb+ connector UI centrally, and may help when different authentications are set at kdb+ like Kerberos/Custom etc. The output of this script is expected to be a JSON object like below. <pre>{ "host": "localhost", "port": 5001, "username": "", "password": "" }</pre> <p>NOTE: Starting with the 21.2 release, the the kdb+ connection pool feature of Panopticon (<code>kdb.connection.pool.xx</code>) can be used together with the host lookup. So any new connection request from the pool, will first execute the script set here, to get the host info before the pool is looked up for available connections.</p> <p>Examples:</p> <ul style="list-style-type: none"> • For Windows

	<pre>connector.kdb.host.lookup.script=E://Data/host.bat</pre> <ul style="list-style-type: none"> For Linux <pre>connector.kdb.host.lookup.script= /etc/panopticon/appdata/host.sh</pre>
Default Value	
Property	Host Lookup
Attribute	<code>connector.kdb.host.lookup.script.arguments</code>
Description	<p>Delimited set of arguments to be passed to the script when it is executed. '{host},{port},{userid},{password}' is the default value, and these parameters are mapped to respective settings in the connector UI i.e., the value entered against these settings in the connector UI are passed as arguments to the script.</p> <p>This property can be extended or updated if you want to pass other datatable parameters as arguments. System parameter like <code>{_user_id}</code> or <code>{_workbook_folder}</code>, if added to the data table, can also be used. If the value of some parameter is null or empty at the time of execution of the script, two single quotes are passed (") against that parameter, this is to make sure that arguments count matches the arguments set at this property.</p>
Default Value	{host},{port},{userid},{password}
Property	Host Lookup
Attribute	<code>connector.kdb.host.lookup.script.arguments.delimiter</code>
Description	Used to split the arguments set at above property.
Default Value	,
Property	Host Lookup
Attribute	<code>connector.kdb.host.lookup.script.timeout</code>
Description	The timeout (in milliseconds) to wait for the host lookup script to run and return the host info.
Default Value	5000
Property	Amazon Kinesis – Data Streams connector
Attribute	<code>connector.kinesis.datastreams.accesskeyid</code>
Description	The Access Key ID from the AWS account.
Default Value	
Property	Amazon Kinesis – Data Streams connector
Attribute	<code>connector.kinesis.datastreams.secretaccesskey</code>
Description	The Secret Access Key ID from the AWS account.
Default Value	
Property	OAuth Token URL
Attribute	<code>connector.oauth.tokenurl</code>
Description	Sets the server-wide token URL.

Default Value	<code>http://localhost:5000/oauth/token</code>
Property	Python connector
Attribute	<code>connector.python.host</code>
Description	<p>The default Python Pyro instance host address.</p> <p>NOTES:</p> <p>For <code>connector.python.host</code>, <code>connector.python.password</code>, <code>connector.python.port</code>, and <code>connector.python.serializertype</code> properties :</p> <ul style="list-style-type: none"> • If set in the <code>Panopticon.properties</code> file, these fields will be hidden in the Python connector and will be applied to the Python transform as well. • These default Panopticon Real Time connection properties will be applied at runtime. <p>These default Panopticon Real Time connection properties will override old Python connection settings.</p>
Default Value	
Property	Python connector
Attribute	<code>connector.python.password</code>
Description	The default HMAC Key.
Default Value	
Property	Python connector
Attribute	<code>connector.python.port</code>
Description	The default Python Pyro host port.
Default Value	
Property	Python connector
Attribute	<code>connector.python.serializertype</code>
Description	The default Python serialization type. Possible values are serpent or pickle .
Default Value	
Property	Rserve connector
Attribute	<code>connector.rserve.host</code>
Description	<p>The default Rserve host address.</p> <p>NOTES:</p> <p>For <code>connector.rserve.host</code>, <code>connector.rserve.password</code>, <code>connector.rserve.port</code>, and <code>connector.rserve.userid</code> properties :</p> <ul style="list-style-type: none"> • If set in the <code>Panopticon.properties</code> file, these fields will be hidden in the Rserve connector and will be applied to the R transform as well. • These default Panopticon Real Time connection properties will be applied at runtime. <p>These default Panopticon Real Time connection properties will override old Rserve connection settings.</p>
Default Value	
Property	Rserve connector

Attribute	<code>connector.rserve.password</code>
Description	The default password that will be used to connect to the Rserve service.
Default Value	
Property	Rserve connector
Attribute	<code>connector.rserve.port</code>
Description	The default Rserve host port.
Default Value	
Property	Rserve connector
Attribute	<code>connector.rserve.userid</code>
Description	The default user Id that will be used to connect to the Rserve service.
Default Value	
Property	Data Store
Attribute	<code>datastore.connection.schema</code>
Description	Name of the database schema to be used for creating or managing objects inside database.
Default Value	dbo
Property	Data Store
Attribute	<code>datastore.type</code>
Description	Controls which data store connector should be used. Valid values are MonetDB , MSSQLServer and PostgreSQL .
Default Value	MonetDB
Property	Data Store
Attribute	<code>datastore.connection.jndi</code>
Description	JNDI resource name for the connection e.g., jdbc/MyDB . More details on how to configure JNDI is at JNDI Connection Details section.
Default Value	
Property	Data Store
Attribute	<code>datastore.connection.url</code>
Description	JDBC connection URL for the database e.g., jdbc:monetdb://localhost:49153/PanopticonDataStore This property value is discarded If <code>datastore.connection.jndiproperty</code> is set.
Default Value	
Property	Data Store
Attribute	<code>datastore.connection.driverclassname</code>
Description	Fully qualified Java class name of the JDBC driver used for the connection.
Default Value	org.monetdb.jdbc.MonetDriver

Property	Data Store
Attribute	<code>datastore.connection.username</code>
Description	Username for the connection. Only required when using connection URL.
Default Value	
Property	Data Store
Attribute	<code>datastore.connection.password</code>
Description	Password for the connection. Only required when using connection URL.
Default Value	
Property	REST Documentation
Attribute	<code>documentation.enabled</code>
Description	Enable or disable the OpenAPI Specification documentation for the REST interface.
Default Value	false
Property	Alert
Attribute	<code>email.address</code>
Description	The email address where the alert will be sent from.
Default Value	
Property	Email
Attribute	<code>email.host</code>
Description	The host name used by the email server.
Default Value	
Property	Alert
Attribute	<code>email.password</code>
Description	The email password, if available.
Default Value	
Property	Email
Attribute	<code>email.port</code>
Description	The port number used by the email server.
Default Value	
Property	Email
Attribute	<code>email.security.mode</code>
Description	The security mode used when sending emails. Possible values: NONE , SSL , TLS .
Default Value	NONE
Property	Email

Attribute	<code>email.username</code>
Description	Email account username.
Default Value	
Property	Error Message
Attribute	<code>error.default.message</code>
Description	Defines a generic error message override.
Default Value	
Property	Image export
Attribute	<code>export.image.height</code>
Description	The default height for an exported image.
Default Value	768
Property	Image export
Attribute	<code>export.image.width</code>
Description	The default width for an exported image.
Default Value	1024
Property	File Upload
Attribute	<code>file.upload.size.max.bytes</code>
Description	Limit for files size (in bytes) to be uploaded through the web browser (i.e., workbooks, streams applications, streams data sources).
Default Value	30000000
Property	Copy Image
Attribute	<code>image.client.timeout</code>
Description	Specifies a timeout (in milliseconds) when producing an image or PDF. If it takes longer than the timeout, the process will be interrupted, and the image/PDF will not be produced.
Default Value	600000
Property	kdb+ Connection Pooling
Attribute	<code>kdb.connection.pool.max.size</code>
Description	The maximum number of connections that will be kept open for reuse for each kdb+ server (among kdb+ servers that use the same username, password, TLS flag, and timeout), so that established connections can be reused when subsequent queries come in for the same server. A benefit of the connection pool is that it can reduce latency. Setting this property to 0 disables the connection pool.
Default Value	10
Property	kdb+ Connection Pooling
Attribute	<code>kdb.connection.pool.ttl</code>
Description	Time to live in milliseconds for each connection instance created.

Default Value	30000
Property	Licensing
Attribute	<code>license.hwu.hosted</code>
Description	Boolean stating if you wish to use Managed or Local Altair Units licensing. Set to true if you wish to use managed licensing.
Default Value	false
Property	Licensing
Attribute	<code>license.hwu.hosted.authorization.password</code>
Description	Password to the Altair One account.
Default Value	
Property	Licensing
Attribute	<code>license.hwu.hosted.authorization.token</code>
Description	An authorization token generated through the Altair One admin portal. Used to authorize a machine to the managed Altair Units system.
Default Value	
Property	Licensing
Attribute	<code>license.hwu.hosted.authorization.username</code>
Description	Username to the Altair One account.
Default Value	
Property	Licensing
Attribute	<code>license.hwu.uri</code>
Description	The path where the License Server is running e.g., 6200@191.255.255.0 where the syntax is <code>PORTNUMBER@HOST</code> . If multiple servers are specified, use the ';' semicolon separator sign for Windows and the ':' colon separator sign for Linux. NOTE: If value is not set in the <code>Panopticon.properties</code> , the environment variable ALTAIR_LICENSE_PATH serves as the backup path and will be used.
Example	For Windows: <code>license.hwu.uri=6200@192.168.5.51;6200@192.168.5.52</code> For Linux: <code>license.hwu.uri=6200@192.168.5.51:6200@192.168.5.52</code>
Default Value	
Property	Licensing
Attribute	<code>license.hwu.use_client_timezone</code>
Description	Determines how the ALJDK should process the timezone details. If set to true , the ALJDK will process the timezone details sent by Panopticon client to the Panopticon server. If set to false , the Panopticon server timezone is used.
Default Value	true

Property	Licensing
Attribute	<code>license.hwu.version</code>
Description	Value must match the license version found in the Altair Units license file.
Default Value	19.0
Property	Licensing
Attribute	<code>license.mode</code>
Description	The license mode. Possible values are FILE or HWU . To use the Altair Units license, set this property to HWU.
Default Value	FILE
Property	Log level
Attribute	<code>logger.level.file</code>
Description	Controls the level that is logged to file.
Default Value	WARNING
Property	Server Metrics
Attribute	<code>metrics.authorization.level</code>
Description	Specifies the required authorization level to get server metrics. Available values are ANONYMOUS, VIEWER, DESIGNER, ADMINISTRATOR . NOTE: This property is case sensitive.
Default Value	ADMINISTRATOR
Property	Server Metrics
Attribute	<code>metrics.collection.rate</code>
Description	Specifies the rate at which metrics are collected in milliseconds.
Default Value	1000
Property	Server Metrics
Attribute	<code>metrics.file.flush.rate</code>
Description	Specifies how often metrics should be saved to disk in milliseconds. Only used if the <code>metrics.publisher.type</code> is set to FILE .
Default Value	10000
Property	Server Metrics
Attribute	<code>metrics.memory.queue.size</code>
Description	Specifies how many metric entries are stored in memory. When the number of metrics goes above the specifies value, the oldest value is removed to make room for the newest one (FIFO). Only used if the <code>metrics.publisher.type</code> is set to MEMORY .
Default Value	100
Property	Server Metrics
Attribute	<code>metrics.publisher.configuration</code>

Description	Specifies the id for which metric publisher configuration to use.
Default Value	
Property	Server Metrics
Attribute	<code>metrics.publisher.type</code>
Description	Specifies the current metric publisher that is used. Available values are NONE, MEMORY, FILE, EMAIL, INFLUX_DB, JDBC, KAFKA, KDB, MQTT, REST, TEXT .
Default Value	MEMORY
Property	Bookmarks repository
Attribute	<code>repository.import.bookmarks.paths</code>
Description	Will import bookmarks from the old format into the repository. Will override any existing bookmarks inside the repository. Must be set to an absolute path. Only bookmarks for workbooks that exists inside the repository will be imported.
Default Value	
Property	Workbook repository
Attribute	<code>repository.migrate.archive.path</code>
Description	Use this property if you have an older (pre 2020) server and wish to start the new server with the same workbook content as the old one, and also to import the workbooks' change history from the old server. Set the property to the absolute path to the old server's <code><appdata>/Archive/</code> directory, delete the new server's <code><appdata>/ .repository/</code> directory, and start the new server. You typically use this property with the <code>repository.migrate.workbooks.path</code> property. See also the section on content migration .
Example	C:\vizserverdata/Archive
Default Value	
Property	Bookmarks repository
Attribute	<code>repository.migrate.bookmarks.path</code>
Description	Will migrate bookmarks from the old format into the repository if there are no bookmarks inside the repository yet. Set to an absolute path or to the default <code>Bookmarks</code> folder. Only bookmarks for workbooks that exists inside the repository will be migrated. NOTE: If you do not wish to migrate bookmarks or already have bookmarks in the repository, set this property to blank to avoid a warning on startup.
Default Value	Bookmarks
Property	Workbook repository
Attribute	<code>repository.migrate.data.extracts.path</code>
Description	Starting with version 21.0, data extracts are stored inside the repository. If this property is set to GlobalCaches (default value), or to an absolute path, the server will migrate data extracts into the repository on startup as long as the repository does not contain any previous data extracts. NOTE: If you do not wish to migrate data extracts or already have data extracts in the repository, set this property to blank to avoid a warning on startup.
Default Value	GlobalCaches

Property	Data Templates Repository
Attribute	<code>repository.migrate.datatable.templates.path</code>
Description	Will migrate data table templates from the old format into the repository if there are no data table templates inside the repository yet. Set to an absolute path or to the default <code>Datatables</code> folder. NOTE: If you do not wish to migrate data table templates or already have data table templates in the repository, set this property to blank to avoid a warning on startup.
Default Value	Datatables
Property	Themes repository
Attribute	<code>repository.migrate.themes.path</code>
Description	Will migrate themes from the old format into the repository if there are no themes inside the repository yet. Set to an absolute path or to the default Themes folder. NOTE: If you do not wish to migrate themes or already have themes in the repository, set this property to blank to avoid a warning on startup.
Default Value	Themes
Property	Workbook repository
Attribute	<code>repository.migrate.workbooks.path</code>
Description	Use this property if you have an older (pre 2020) server and wish to start the new server with the same workbook content as the old one. Set the property to the absolute path to the old server's <code><appdata>/Workbooks/</code> directory, delete the new server's <code><appdata>/ .repository/</code> directory, and start the new server. See also the section on content migration .
Example	C:\vizserverdata/Workbooks
Default Value	
Property	Workbook repository
Attribute	<code>repository.pack.enabled</code>
Description	The repository tracks all changes to all workbooks. If you have a very large number of workbooks, or have kept the repository for a very long time, the sheer number of files inside the <code>.repository</code> subdirectory could cause the repository to become slower. Set this property to true to have the repository pack all the files into fewer larger ones for faster access.
Default Value	false
Property	Repository
Attribute	<code>repository.startup.apply.permissions.clean</code>
Description	Use this property with the <code>repository.startup.apply.permissions.path</code> to reset all existing workbook permissions on the server before applying the template. If you set it to true , the server will remove all permissions, then give users full permissions to their private folders, and the "Everyone" group full permissions to public folders.
Default Value	false
Property	Repository
Attribute	<code>repository.startup.apply.permissions.create</code>

Description	Use this property with the <code>repository.startup.apply.permissions.path</code> to create empty workbook folders for any folders that are in the template file but do not yet exist on the server. If you don't set it to true , these folders from the template will be ignored.
Default Value	true
Property	Repository
Attribute	<code>repository.startup.apply.permissions.path</code>
Description	Use this property to make the server apply workbook folder permissions from a template JSON file on startup. Workbook folder permissions in the template will overwrite any existing permissions on the server. This property will not migrate permissions from an older (pre 2020) server, you need to use the PCLI <code>convertpermissions</code> to generate a template file from the old permissions first. See also <code>repository.startup.apply.permissions.clean</code> and <code>repository.startup.apply.permissions.create</code> .
Default Value	
Property	Repository
Attribute	<code>repository.startup.filesystemcheck</code>
Description	<p>If set to true, server runs on startup to verify the repository integrity and reports any of the following issues:</p> <ul style="list-style-type: none"> • a deleted <code>/HEAD</code> file, • a modified <code>/HEAD</code>, • a modified <code>/refs/heads/master</code> file, • any file deleted inside <code>/objects/</code> (e.g., <code>/objects/94/443eec118fb8bb2021071896ff7d386a9c9518</code>), • any file modified inside <code>/objects/</code>. <p>NOTE: There may be dangling files in the <code>/objects/</code> directory or those that are not in use. These files are typically results of failed saves and/or sync conflicts. The check may or may not detect deleted or modified dangling files, but that is not critical.</p>
Default Value	false
Property	Repository Import
Attribute	<code>repository.startup.import.paths</code>
Description	<p>NOTE: Use this property to make the server import content at startup. This is imported on top of the existing content and will always overwrite anything that is already there. This property can be useful for example, if you have multiple servers with different content but you want the latest version of a standard set of workbooks to be deployed on all of them. This property only has effect on a stand-alone or leader server.</p> <p>This property is the list of paths to directories and files, separated by the system specific path separator “;” on Windows and “:” on Linux. Each directory is scanned and imported keeping its local tree structure.</p> <p>For example, workbooks to be imported are placed in a folder and in this property, the absolute path to that folder is specified.</p> <p>ADDITIONAL NOTES:</p> <ul style="list-style-type: none"> • User-specific folders (e.g., “~john”) can be targeted this way, but only if they already exist on the server.

	<ul style="list-style-type: none"> Bundles (exz files) directly listed in the property or found in directories listed are also imported, but always to the root, with their internal structure preserved. Files that are not legacy workbooks or bundles are ignored. The same set of workbooks will get imported over and over (startup, user edit, restart) and for bundles (nothing changes in the history the second time), but legacy workbooks change their meta data. The import always overwrites local changes (it resets the workbooks in the repository). <p>Permissions are not supported, and any folders created will have "SYSTEM" as owner.</p>
Default Value	
Property	Request parameter mapping
Attribute	<code>request.cookie.parameters.mapping.entry.delimiter</code>
Description	The delimiter that separates the configuration entries. This property will only affect incoming parameters.
Default Value	, (Comma)
Property	Request parameter mapping
Attribute	<code>request.cookie.parameters.mapping.optional</code>
Description	The parameters that could be updated with certain cookie values. This property will only affect incoming parameters. The operation will not fail if the cookie values are not present in the request. The parameters will keep their default value instead of the configured cookie value if the cookie is not present. The property should be formatted as follows: Parameter name (Value delimiter) Cookie name.
Default Value	
Property	Request parameter mapping
Attribute	<code>request.cookie.parameters.mapping.required</code>
Description	The parameters that are required to be updated with certain cookie values. This property will only affect incoming parameters. The operation will fail if configured cookie values are not present in the request. The property should be formatted as follows: Parameter name (Value delimiter) Cookie name.
Default Value	
Property	Request parameter mapping
Attribute	<code>request.cookie.parameters.mapping.value.delimiter</code>
Description	The delimiter that separates the parameter name and the cookie name. This property will only affect incoming parameters.
Default Value	: (Colon)
Property	Request parameter mapping
Attribute	<code>request.header.parameters.mapping.entry.delimiter</code>
Description	The delimiter that separates the configuration entries. This property will only affect incoming parameters.
Default Value	, (Comma)
Property	Request parameter mapping

Attribute	<code>request.header.parameters.mapping.optional</code>
Description	The parameters that could be updated with certain header values. This property will only affect incoming parameters. The operation will not fail if the header values are not present in the request. The parameters will keep their default value instead of the configured header value if the header is not present. The property should be formatted as follows: Parameter name (Value delimiter) Header name.
Default Value	
Property	Request parameter mapping
Attribute	<code>request.header.parameters.mapping.required</code>
Description	The parameters that are required to be updated with certain header values. This property will only affect incoming parameters. The operation will fail if a configured header values are not present in the request. The property should be formatted as follows: Parameter name (Value delimiter) Header name.
Default Value	
Property	Request parameter mapping
Attribute	<code>request.header.parameters.mapping.value.delimiter</code>
Description	The delimiter that separates the parameter name and the header name. This property will only affect incoming parameters.
Default Value	: (Colon)
Property	Response parameter mapping
Attribute	<code>response.operation.parameters.mapping.entry.delimiter</code>
Description	The delimiter that separates the configuration entries. This property will only affect outgoing parameters.
Default Value	, (Comma)
Property	Response parameter mapping
Attribute	<code>response.operation.parameters.mapping.optional</code>
Description	The parameters that could be updated with certain Header values. This property will only affect outgoing parameters. The operation will not fail if the Header values are not present in the request. The parameters will keep their default value instead of the configured Header value if the Header is not present. The property should be formatted as follows: Parameter name (Value delimiter) Header name.
Default Value	
Property	Response parameter mapping
Attribute	<code>response.operation.parameters.mapping.required</code>
Description	The parameters that are required to be updated with certain Header values. This property will only affect outgoing parameters. The operation will fail if configured Header values are not present in the request. The property should be formatted as follows: Parameter name (Value delimiter) Header name.
Default Value	
Property	Response parameter mapping
Attribute	<code>response.operation.parameters.mapping.value.delimiter</code>

Description	The delimiter that separates the parameter name and the Header name. This property will only affect incoming parameters.
Default Value	: (Colon)
Property	REST
Attribute	<code>rest.response.error.stacktrace.included</code>
Description	Include the error stack trace in REST responses.
Default Value	false
Property	Compatibility
Attribute	<code>server.force_downgrade</code>
Description	The server normally refuses to start if it detects that the <code>AppData</code> directory has been used by a server with a newer version. This is because downgrading content and other <code>AppData</code> files is not supported and can cause irreversable issues. You can set this property to true to force the server to start anyway, but it is strongly recommended that you do not.
Default Value	false
Property	Email
Attribute	<code>server.host</code>
Description	The server endpoint address. This will be used to generate links in emails sent by the server, so it should be the server's or load balancer's public URL and needs to be resolvable from the email recipient's machine. For example: <code>server.host=http://www.company.com/dashboards/</code>
Default Value	
Property	PDF and Image generation
Attribute	<code>server.host.internal</code>
Description	The local server endpoint address. To generate PDFs and images, the server fires up an external process which then makes HTTP calls to the server itself. This URL needs to be resolvable on the server itself. For example: <code>server.host.internal=http://127.0.0.1:8080/panopticon/</code>
Default Value	
Property	Server
Attribute	<code>server.id</code>
Description	Specifies an id for the current server. The value of this property will be part of each metric entry so that it can be tied to a specific server if a server cluster is used. If no value is specified, the MAC address of the localhost network will be attempted to be used to identify the server. If this is not possible, a UUID will be generated.
Default Value	
Property	SOAP
Attribute	<code>soap.enabled</code>
Description	Enable or disable the SOAP interface

Default Value	true
Property	Data table regression testing
Attribute	<code>startup.regression.datatable.exclude.folders</code>
Description	Comma-separated list of folders that will be excluded in the testing. Use this property in combination with the <code>startup.regression.datatable.include.folders</code> property to control which workbooks to include in the testing. For example, you can set <code>startup.regression.datatable.include.folders</code> to "pub\" and <code>startup.regression.datatable.exclude.folders</code> to "pub\examples\,pub\temp\" .
Default Value	
Property	Data table regression testing
Attribute	<code>startup.regression.datatable.include.folders</code>
Description	Comma-separated list of folders to test. The default is blank, which means the root folder and all workbooks will be tested. If you list folders here, then only the data tables in workbooks in these folders will be tested, unless also excluded. Folder paths should include a trailing backslash, and you need to use double backslashes since this is the escape character in Java property files. For example, to only include prod and qa\final , you should set the property to "prod\,qa\final\" (without quotes).
Default Value	
Property	Data table regression testing
Attribute	<code>startup.regression.datatable.runonce</code>
Description	If set to true , the server will run a data table regression test during the next startup. The property is immediately reset to false , so you need to set it to true again to run another test. NOTE: You can set the property through an environment variable if you want to force the server to run it on every startup.
Default Value	false
Property	Authorization
Attribute	<code>statistics.authorization.level</code>
Description	Allows users to set the authorization level for the statistics and diagnostic REST services. Possible values include: ANONYMOUS , VIEWER , DESIGNER , ADMINISTRATOR . NOTE: This property is case sensitive.
Default Value	ADMINISTRATOR
Property	Statistics
Attribute	<code>statistics.accumulated.enabled</code>
Description	By default, the server accumulates statistics from every run into files in <code><appdata>/Statistics/</code> , e.g., <code>WorkbookStatistics_Accumulated.json</code> . You can delete these files if you are not interested in this information, or you can set this property to false to disable the accumulation completely.

Default Value	true
Property	Subscription
Attribute	<code>subscription.broadcasting.pool.max.size</code>
Description	<p>The maximum number of threads for the broadcasting thread pools of refresh events.</p> <p>The default value is empty, which means that there is no limit. Any value less than 1 also means that there is no limit. When setting a max value for the thread pools, it means that the pool cannot create more than that number of threads. If there are more concurrent events handled by the thread pools than there are threads, they are queued until a thread becomes available.</p> <p>The thread pools are also configured to only increase the pool size if all threads are busy and a new event needs to be processed. If a thread is idle more than 1 minute, it will be removed from the pool and the size of the pool thereby decreases.</p> <p>Any subscription for a static data source are scheduled to refresh each X seconds (based of the refresh period of the datatable) using the TaskScheduled built in to Spring.</p> <p>If multiple subscriptions with the same data query tries to load data at the same time, only one thread will actually load the data. The rest of the subscriptions are queued. When the data is loaded all waiting subscriptions will be given the same data set that are then broadcasted to their respective client.</p>
Default Value	
Property	Subscription
Attribute	<code>subscription.compression.delta.enabled</code>
Description	<p>With delta compression, the server only sends the difference from the last data result on each refresh. For data where only a fraction changes on each refresh, this means much smaller response messages.</p> <p>The trade-offs are that both client and server need to keep the last result to calculate the difference and apply it, and that this operation takes some additional time both on the server and the client.</p> <p>In rare cases, delta compression may worsen performance, e.g., if you have a large data set with very high refresh rate and a large portion of the data changes on each refresh. You can then disable delta processing completely by setting this property to false.</p>
Default Value	true
Property	Subscription
Attribute	<code>subscription.compression.enabled</code>
Description	Enable or disable compression and encoding of subscription broadcast messages.
Default Value	true
Property	Subscription
Attribute	<code>subscription.congestion.control.enabled</code>
Description	When the server loads data for a subscription, it checks that the previous data load for it has completed. If not, it might be a sign that the refresh rate is set too high on the data table. If this happens subscription.maximum.failure times in a row, the server will cancel the subscription. Set this property to false to disable this behavior.
Default Value	true
Property	Subscription
Attribute	<code>subscription.data.loading.pool.max.size</code>

Description	<p>The maximum number of threads for loading thread pools of refresh events.</p> <p>The default value is empty, which means that there is no limit. Any value less than 1 also means that there is no limit. When setting a max value for the thread pools, it means that the pool cannot create more than that number of threads. If there are more concurrent events handled by the thread pools than there are threads, they are queued until a thread becomes available.</p> <p>The thread pools are also configured to only increase the pool size if all threads are busy and a new event needs to be processed. If a thread is idle more than 1 minute, it will be removed from the pool and the size of the pool thereby decreases.</p> <p>Any subscription for a static data source is scheduled to refresh each X seconds (based of the refresh period of the data table) using the TaskScheduled built into Spring.</p> <p>If multiple subscriptions with the same data query tries to load data at the same time, only one thread will actually load the data. The rest of the subscriptions are queued. When the data is loaded all waiting subscriptions will be given the same data set that are then broadcasted to their respective client.</p>
Default Value	
Property	Subscription
Attribute	<code>subscription.limitation.action</code>
Description	Controls the behavior when the <code>subscription.limitation.limit</code> is reached. Allowed values: EXCEPTION, PURGE
Default Value	EXCEPTION
Property	Subscription
Attribute	<code>subscription.limitation.enabled</code>
Description	Enables limitation of subscriptions.
Default Value	false
Property	Subscription
Attribute	<code>subscription.limitation.limit</code>
Description	Defines a subscription limit.
Default Value	100
Property	Subscription
Attribute	<code>subscription.log.slow.data.loads.seconds</code>
Description	<p>Logs a subscription that has been loading data for more than X seconds at a WARNING level.</p> <p>NOTES:</p> <ul style="list-style-type: none"> Any integer less than 1 (or an empty value) will disable the logging. If a slow data load has been logged and then returns data, a log message at INFO level will be printed stating that a previously logged slow data load has returned data.
Default Value	60
Property	Subscription
Attribute	<code>subscription.maximum.failure</code>
Description	The amount of time a subscription is allowed to fail in a row before it should be cancelled. The number will be reset to zero if data loading is successful. The maximum failure limit is

	used so that invalid subscription will not loop forever and fill the logs with error messages. The value -1 will disable the fail mechanism. This means that a subscription can fail endless of times and not be cancelled.
Default Value	5
Property	Subscription
Attribute	<code>subscription.purge.condition</code>
Description	Defines the condition for when subscriptions will be purged. Allowed values: NONE, MEMORY
Default Value	NONE
Property	Subscription
Attribute	<code>subscription.purge.condition.memory.threshold</code>
Description	Defines a percentual memory threshold for subscription purging, when the <code>subscription.purge.condition = MEMORY</code> .
Default Value	80
Property	Subscription
Attribute	<code>subscription.purge.enabled</code>
Description	Enables subscription purging.
Default Value	true
Property	Subscription
Attribute	<code>subscription.purge.post.restart</code>
Description	Option to re-start active subscriptions after purge. Only valid when <code>subscription.purge.scope = ALL</code>
Default Value	false
Property	Subscription
Attribute	<code>subscription.purge.rate</code>
Description	Defines a fixed rate, in milliseconds. for subscription purging.
Default Value	10000
Property	Subscription
Attribute	<code>subscription.purge.scope</code>
Description	Defines the scope of subscriptions to purge. Allowed values: NON_PERSISTENT_ORPHANS, ALL .
Default Value	NON_PERSISTENT_ORPHANS
Property	Timeout Session
Attribute	<code>timeout.session.enabled</code>
Description	Boolean value stating if timeout functionality should be used or not.
Default Value	false

Property	Timeout Session
Attribute	<code>timeout.session.exception.delimiter</code>
Description	The delimiter to use for the usernames stated in the <code>timeout.session.exception.usernames</code> property.
Default Value	, (comma)
Property	Timeout Session
Attribute	<code>timeout.session.exception.usernames</code>
Description	Usernames that should be excluded from the timeout functionality. Separated by the delimiter stated in the <code>timeout.session.exception.delimiter</code> property.
Default Value	
Property	Timeout Session
Attribute	<code>timeout.session.minutes</code>
Description	Minutes of inactivity before a user session is terminated by logging out the user.
Default Value	480
Property	Timeout Session
Attribute	<code>timeout.session.notification.minutes</code>
Description	Minutes before a timeout that a notification about session timeout is sent to the user.
Default Value	1
Property	WebSocket Connection
Attribute	<code>transport.buffer.size.max.bytes</code>
Description	Maximum size of message buffer for the WebSocket connections.
Default Value	1000000
Property	WebSocket Connection
Attribute	<code>transport.message.size.max.bytes</code>
Description	Maximum size of messages for the WebSocket connections.
Default Value	1000000
